

Alla Vostra Mobile App Work Log - July 11, 2026

Compiled summary for Saturday, July 11, 2026 - focus: Android Play Store test-build preparation, Expo/EAS project linkage, Play-ready app identity, preview/internal-test AAB workflow, EAS archive slimming, launch checklist updates, and local release-helper standardization.

Generated in continuity with the established daily worklog cadence: compact opening summary, source-material section, baseline section, goal list, work-complete sections, validation section, files-touched list, follow-up context, and output-artifact close.

This artifact intentionally stops at the Play Store test-build preparation work represented by commit 77d20db. Later unrelated project-search, portfolio, or non-Alla-Vostra conversation context is excluded from this record.

Source Material Reviewed

- Reviewed existing Alla Vostra worklog PDFs from May through July, with special attention to the July 7, July 8, and July 9 mobile-app artifacts for current naming, section order, validation language, and root-level PDF convention.
- Reviewed the active repository at /Users/prahlin/gh/alla_vostra, which is the current local Alla Vostra checkout.
- Reviewed July 11 Git history and confirmed one tracked Alla Vostra commit for this worklog scope: 77d20db.
- Reviewed the commit patch and stats for .easignore, PLAY_STORE_LAUNCH_CHECKLIST.md, build_alla_vostra_android_playstore.sh, mob/.easignore, mob/app.json, and mob/eas.json.
- Reviewed the Play Store launch checklist, EAS build configuration, Expo app configuration, EAS ignore rules, local build helper script, and the downloaded internal-test AAB artifact.
- Reviewed store asset metadata for app icon, adaptive foreground, feature graphic, and splash logo files already referenced by the mobile app configuration.

Baseline Status Before Today's Work

- Primary app work remains in /Users/prahlin/gh/alla_vostra/mob, using Expo Router, React Native, shared Shop cart context, Stripe payment integrations, Android payment testing, and the established Alla Vostra mobile visual system.
- Android payment testing had already moved far enough to prepare Play Console internal testing, with card, Google Pay, and PayPal workflows treated as Android test priorities and Apple Pay still outside Android-only validation.
- The project already had a Play Store launch checklist and release-build helper in place, but the Android app still needed tighter EAS linkage, preview-vs-production profile separation, and upload-size hygiene before Play internal testing.
- The mobile app needed permanent Play identity details preserved in app configuration rather than relying on generated native state.
- The local repository now contains ignored/generated material such as dist/, mob/android/, mob/node_modules/, server/node_modules/, local env files, screenshots, and .DS_Store files that should remain outside release source control.

Goals for July 11

- Link the mobile app to the correct Expo/EAS project and owner.
- Preserve the Play Store Android package identity and store-facing app metadata in mob/app.json.
- Add a Play-uploadable internal-test AAB profile that can use preview environment variables and Stripe test-mode payment configuration.
- Keep production and preview/test build paths distinct so test builds do not blur into production release claims.
- Slim EAS build uploads by excluding generated native folders, backend/server folders, screenshots, logs, local env files, unnecessary image variants, draft we

b files, and unused font/license material.

- Update the Play Store launch checklist with the internal-test AAB workflow and the first downloaded test artifact path.
- Make the Android build helper accept a profile argument and run EAS builds without requiring clean local Git state.

Work Completed - Expo and Play App Identity

- Updated mob/app.json so the Expo slug is the stable release slug alla-vostra rather than the older mobile-specific slug.
- Added the Expo/EAS project id 5c39d44b-1b4e-4852-92ef-472349741e35 under the app extra.eas configuration.
- Added the Expo owner prahlin1s-team so EAS builds are associated with the intended account/team context.
- Preserved the Android package as com.allavostra.app and versionCode as 1 for the first Play upload path.
- Preserved store-facing icon, adaptive icon, splash, Android status bar, Android navigation bar, navigation-bar plugin, Material Components theme plugin, and Stripe plugin configuration in the Expo app config.
- Kept Google Pay enabled through the Stripe React Native plugin configuration while leaving the Android-focused release work scoped to Play testing.

Work Completed - EAS Build Profiles

- Updated mob/eas.json so development, preview, playTest, and production profiles explicitly declare their EAS environments.
- Kept development and preview as APK-oriented internal-distribution profiles for local/internal install workflows.
- Added the playTest profile as an Android app-bundle profile using the EAS preview environment.
- Preserved the production profile as an Android app-bundle profile using the EAS production environment.
- Kept the submit.production placeholder in place for later Play submission wiring.
- Created a clean distinction between Play Console test uploads that use preview/test-mode env and final production uploads that should use production env.

Work Completed - EAS Upload Hygiene

- Added a root-level .easignore so EAS uploads from the repository root do not include generated or unrelated project material.
- Expanded mob/.easignore so EAS uploads from mob/ stay focused on the actual app source and required runtime assets.
- Ignored generated native folders, dependency folders, build outputs, web-build outputs, Expo local state, logs, local env files, Python cache files, editor swap files, .DS_Store files, and IDE metadata.
- Excluded backend/server, other web drafts, API folders, screenshots, generated dist output, and development-only mobile HTML/CSS/Python/test files from build uploads.
- Excluded broad mobile JPG/PNG sets by default, then allowlisted the specific runtime image assets required by the current app configuration and visual system.
- Trimmed unused font/license payload from EAS uploads by excluding font specimen PDFs, extra TT Fonts trial styles, and the Dream Avenue OTF that is not part of the needed build payload.
- Preserved .env.example files as documentation while excluding real local .env files.

Work Completed - Play Test Build Helper and Checklist

- Updated build_alla_vostra_android_playstore.sh so it accepts an optional EAS profile argument, defaulting to production.
- Added EAS_NO_VCS=1 to the helper so the cloud build can proceed from the local

- working tree without EAS requiring a clean Git state for this workflow.
- Preserved the Java 17 guard and EAS login guard in the helper.
- Updated PLAY_STORE_LAUNCH_CHECKLIST.md with the playTest build command.
- Documented that the playTest profile builds a Play-uploadable AAB using the EA S preview environment.
- Recorded the first downloaded internal-test AAB path in the checklist: dist/alla-vostra-play-test-v1.aab.
- Kept the checklist language focused on Play Console internal/closed testing, production environment requirements, store listing copy, app content forms, testing tracks, and local build tooling.

Work Completed - Internal-Test Artifact Capture

- Built and downloaded the first Play internal-test Android App Bundle artifact locally.
- Stored the local downloaded AAB at dist/alla-vostra-play-test-v1.aab.
- Confirmed the artifact is a local generated build output and remains outside tracked source control through ignore rules.
- Recorded the AAB size as approximately 71 MB.
- Recorded the local SHA-256 digest for traceability: 8857a2fa414cebd4dffffcc72f8b71f2f01384ccf9a8d8c753645b8efab24e698.
- Kept the artifact positioned as an internal/closed test upload candidate, not a final production release claim.

Validation and Checks Performed

- Reviewed Git history for July 11 and confirmed the tracked source scope for this artifact is commit 77d20db.
- Reviewed git show --stat and git show --patch for the July 11 commit before generating this PDF.
- Freshly ran git diff --check before PDF generation; no whitespace or patch-format issues were reported.
- Freshly ran bash -n build_alla_vostra_android_playstore.sh before PDF generation; no shell syntax errors were reported.
- Freshly parsed mob/app.json and mob/eas.json with Node JSON parsing before PDF generation; both files parsed successfully.
- Confirmed the downloaded AAB exists at dist/alla-vostra-play-test-v1.aab and captured its local size and SHA-256 digest.
- Confirmed store asset dimensions with file metadata: app icon 512 x 512, adaptive foreground 432 x 432, feature graphic 1024 x 500, and splash logo 1024 x 1024.
- Confirmed ignored local/generated material remains out of source control, including dist/, mob/.env, mob/.expo, mob/android, mob/node_modules, server/.env.local, server/node_modules, screenshots, and .DS_Store files.
- Did not include any later portfolio work, session-history lookup work, or non-Alla-Vostra material in this artifact.
- Did not run a new production release build during this worklog-generation step; this record documents the Play internal-test preparation and the previously downloaded play-test AAB artifact.

Files Touched During July 11

- .easignore
- PLAY_STORE_LAUNCH_CHECKLIST.md
- build_alla_vostra_android_playstore.sh
- mob/.easignore
- mob/app.json
- mob/eas.json
- dist/alla-vostra-play-test-v1.aab as a generated local build artifact, not tracked source

Follow-Up Context

- Upload the internal-test AAB to Google Play Console once the developer account setup and required verification steps are complete.
- Add internal testers or a tester group, publish the internal test, and send testers the opt-in link.
- Use the Play internal-test build to verify launch, checkout, Google Pay, card payment, PayPal redirect behavior, contact form behavior, and order-email delivery.
- Keep production upload separate from preview/test upload until production backend URLs, live Stripe keys, Postmark sender configuration, privacy policy URL, screenshots, Play content forms, and final versionCode decisions are complete.
- Continue treating Apple Pay as an iOS validation item outside the Android-only Play Store testing path.
- Keep EAS ignore rules under review whenever new runtime images or fonts are added, because required assets must be explicitly preserved while draft/generated material stays out of cloud build uploads.

Output Artifact

- Filename: alla_vostra_worklog_july11.pdf
- Created at the repository root in /Users/prahlin/gh/alla_vostra.
- Follows the established root-level Alla Vostra daily worklog naming convention.
