

Alla Vostra Mobile App Work Log - June 15, 2026

Compiled summary for June 15, 2026 - focus: global border/shadow logic, Shop overlay navigation polish, carousel-style product switching, Android back-button behavior, asset recoloring, dimming rules, and final action-button geometry.

Date note: the request said Sunday, June 15th. The local snapshots and Git history identify June 15, 2026 as Monday, June 15, 2026; this artifact covers that June 15 mobile-app work.

Includes tracked Git work from the June 15 mobile-app session, Expo tunnel and route/dependency troubleshooting, local PNG asset refinements, repeated Android export checks, and the current Shop overlay baseline after the cart-placeholder addition.

Generated automatically on June 17, 2026 for the June 15 daily worklog after reviewing the repository snapshots, prior PDF worklogs, June 15 Git history, and current Shop/Header source files.

Source Materials Processed

- Read the existing root-level June worklog PDFs, especially June 12 and June 13, to preserve the established PDF naming convention, title cadence, footer style, compact bullet format, and source/follow-up section order.
- Reviewed the app and web project snapshots generated on Mon Jun 15 12:05:37 EDT 2026, plus the active mobile source under /Users/prahlin/alla_vostra/mob.
- Reviewed June 15 Git history from commit aaa59f6 through de41595, covering border/hairline work, routing/dependency changes, overlay carousel behavior, asset recolors, global button shadows, Android back handling, and the placeholder cart button.
- Checked current hotspots in mob/app/shop.js, mob/styles/shopStyles.js, mob/components/AppHeader.js, mob/styles/headerStyles.js, and mob/styles/borderEffects.js to confirm the final code state before generating this artifact.
- Reviewed package-level changes showing react-native-svg as the retained graphics dependency and a simplified Babel config after the earlier Skia/Reanimated experiment was backed away from.

Current Baseline to Preserve

- Primary app work remains in /Users/prahlin/alla_vostra/mob with Expo Router, Expo SDK 54, React Native 0.81.5, and Expo Go on the Samsung S21 FE as the practical runtime target.
- The Shop route remains a fixed, highly tuned one-screen preview with top cartoon offering rows, a bottom action button, and an overlay product selector rather than a long scroll page.
- The Shop overlay now supports product switching through both the top nav and swipe/chevron interactions, with Piccola still the default product whenever the overlay opens.
- The global visual vocabulary is now cream #FFFCF2, orange #f7b967, white callouts where needed, thick black borders for major tappable surfaces, and very subtle hairlines between orange/cream/white sections.
- Tappable, thick-bordered buttons now use a shared rendered shadow plate rather than relying only on platform shadow opacity, which made Android visual changes hard to see.

Main Goals We Worked Toward

- Make the Shop overlay feel like an intentional premium product surface rather than a rough popup, with cleaner nav, smoother transitions, and more controlled edge/hairline behavior.
- Keep the orange active state unmistakable by removing gray-line/shadow bleed into orange nav areas while still preserving subtle bottom and vertical hairlines where requested.
- Make product imagery richer by filling selected transparent PNG regions with brand-consistent white, orange, red, and yellow without replacing the original cartoon outlines.
- Unify thick black border treatment and button depth globally, while keeping hairlines almost imperceptible and free of drop-shadow smudging.
- Reduce user frustration around Android navigation by making the native back chevron close the

Shop overlay first instead of leaving the Shop screen entirely.

Work Completed - Expo, Routing, and Dependency Recovery

- Diagnosed an Expo tunnel startup failure where `./node_modules/.bin/expo start --tunnel --clear` failed with remote gone away from the ngrok tunnel layer, separating tunnel health from the local project state.
- Handled a route failure after an experimental graphics-library path: the Shop route temporarily reported a missing default export because `react-native-reanimated` was not installed for the imported Skia components.
- Backed away from the problematic Skia/Reanimated path for the Shop border-gradient experiment and retained a safer React Native SVG-based approach for local chrome/corner effects.
- Added `mob/app/+not-found.js` so unmatched Expo Router paths resolve more gracefully during development instead of producing a confusing missing-page state.
- Kept package and Babel changes minimal after dependency experimentation, with `react-native-svg` retained and Babel using the Expo preset only.

Work Completed - Global Borders, Hairlines, and Shadows

- Created `mob/styles/borderEffects.js` as the shared home for thick black borders, heavy borders, and thick-border shadows.
- Added consistent hairline logic to the App Header and Shop overlay: subtle gray lines under the top orange banner, around the active Shop button, at overlay orange/nav edges, and along the Android bottom-nav top edge where requested.
- Iterated heavily on overlay nav smudging, removing gray/shadow bleed that made inactive nav areas look active while preserving the gray bottom hairline across nav sections.
- Experimented with Shop button shadow opacity and confirmed that Android elevation often ignores `shadowOpacity`, so a real rendered shadow plate was needed for visible control.
- Added `mob/components/ButtonShadowPlate.js` and a `tappableButtonShadowPlate` token so thick-bordered tappable buttons can share a consistent 2px right / 3px down / 0.09-alpha shadow going forward.
- Applied the shared rendered shadow to the header SHOP button, the Shop ready/back action, and the overlay BUY button without adding shadows to invisible dismiss layers or active nav sections.

Work Completed - Header and Shop Preview Color Rules

- Changed the app header nav bar and inactive indicators through white/cream experiments, settling back on cream while keeping the SHOP button white at all times for contrast.
- Made the SHOP header button route back to Home when tapped from the Shop page, matching the Alla Vostra logo behavior after earlier overlay-open/close experiments.
- Added a dimming effect while the Shop overlay is open: the Shop preview and most of the header dim, while the overlay and header SHOP button remain visually clean.
- Tuned outside-overlay dim strength through 75%, 60%, and 50% experiments, settling on the current 50% black overlay behavior.
- Changed the Shop preview text boxes to white and kept the surrounding black/orange border treatments clean so the cartoon offering rows read more clearly.

Work Completed - Overlay Navigation and Product Switching

- Added carousel-like overlay navigation so Piccola, Sei Perfetto, and Buon Natale can be changed through left/right swipe gestures and overlay chevrons as well as the top nav segments.
- Changed the overlay nav from instant switching to a sliding orange active container while keeping nav text stationary; only text color changes as the orange segment slides underneath.
- Reduced overlay chevron sizes by 50% so they suggest swipe navigation without dominating the

product surface.

- Added directional arrow linger/held-arrow behavior and tuned image transition opacity so product images fade through a circular mask rather than disappearing into a hard invisible wall.
- Kept overlay nav text readable by making active text white over orange and inactive text orange over white/cream.

Work Completed - Overlay Layout, Prices, and BUY Area

- Adjusted product paragraphs, price tags, and BUY buttons so prices center vertically relative to their paragraph columns while BUY buttons remain bottom-aligned with paragraph bottoms.
- Reduced product price font size through multiple one-point passes to improve balance in the action column.
- Added and tuned small red badge text such as POPULAR / ON SALE above the price area.
- Kept all three overlay product BUY actions wired through the product paymentUrl field, while noting that product-specific PayPal URLs can be dropped into the product objects later.
- Applied the shared button shadow treatment to the BUY button through a wrapper frame so the button can keep its existing orange fill, black border, and compact action-column placement.

Work Completed - Ready / Go Back / Android Back Behavior

- Renamed the closed-state action to I'm ready! and the overlay-open state to Go back.
- Reduced the I'm ready! / Go back button width by 20%, matched its corner rounding to the header SHOP button, and removed orange side strips from the Go back state for a cleaner white button.
- Measured the rendered label widths so the ready/back triangles can sit centered between each label edge and the button edge they point toward.
- Reduced both triangles by 5%, then made only the I'm ready! triangle another 10% smaller to correct an optical-size imbalance, and moved the ready triangle down 1px.
- Lifted the Go back button above the Shop dim layer while leaving the preview screen dimmed beneath it, so Go back remains clean and tappable when the overlay is open.
- Added Android BackHandler logic so the phone-native bottom navigation back chevron closes the Shop overlay first instead of returning the user to Home.
- Added an orange rectangular placeholder button to the right of Go back, with height matching Go back and width computed from the same gap used between Go back and the Android bottom nav area. This placeholder is intended for future shopping-cart / item-count behavior.

Work Completed - Cartoon Asset Color Refinement

- Created and adopted truck1_square_whitefill.png, filling see-through truck body space with white while preserving black outlines, then coloring the cap and wheels orange.
- Refined the truck envelope heart through several passes: isolated the heart fill, changed it red, expanded red into black-edge areas, and rotated it clockwise for a better visual read.
- Created and adopted bargain_square_whitefill.png, then refined the bargain character/sign/money-bag composition to better match the truck image's tricolor direction.
- Filled the bargain sign background white, changed GREAT VALUE! lettering to red, filled hollow stars yellow while preserving outlines, and made the money bag orange without outside orange artifacts.
- Removed remaining white slivers inside the orange money bag, made the coins yellow, and filled the bag rim between the coins and bag with the same yellow.
- Kept these edits as project PNG assets rather than generated-only previews, and verified the Expo asset export after image updates.

Validation and Checks Performed

- Ran repeated parser checks on touched files, including mob/app/shop.js,

- mob/styles/shopStyles.js, mob/components/AppHeader.js, mob/styles/headerStyles.js, mob/styles/borderEffects.js, and the new mob/components/ButtonShadowPlate.js.
- Ran repeated Android export checks with `npx expo export --platform android --output-dir /tmp/alla-vostra-export-test` after structural, styling, and asset changes.
- Used `rg`, `sed`, `git log`, `git show`, and `git diff` to inspect exact active paths before changing code, avoiding stale `web/old-Shop` files.
- Used local PNG analysis/previews for white-fill and recolor changes before copying final candidates into `mob/truck1_square_whitefill.png` and `mob/bargain_square_whitefill.png`.
- Confirmed the final root Git history for June 15 contains the major commits from `aaa59f6` through `de41595`, including the final cart-placeholder commit at 22:19:52 EDT.

Files Touched / Added During June 15

- Primary Shop implementation files: `mob/app/shop.js` and `mob/styles/shopStyles.js`.
- Header and global styling files: `mob/components/AppHeader.js`, `mob/styles/headerStyles.js`, `mob/styles/borderEffects.js`, and `mob/app/_layout.js`.
- New shared button-shadow component: `mob/components/ButtonShadowPlate.js`.
- Routing and dependency files: `mob/app/+not-found.js`, `mob/package.json`, `mob/package-lock.json`, and `mob/babel.config.js`.
- Product-page copy adjustment: `mob/app/products.js`.
- Generated/updated visual assets: `mob/truck1_square_whitefill.png` and `mob/bargain_square_whitefill.png`.
- Updated project snapshots during the day: `alla_vostra_APP_PROJECT_SNAPSHOT.txt` and `alla_vostra_WEB_PROJECT_SNAPSHOT.txt`.
- This final worklog generation creates `alla_vostra_worklog_june15.pdf` at the repository root.

Important Follow-Up Context

- The Shop overlay is now layered carefully: preview dim layer, overlay window, lifted Go back button, and cart-placeholder button all depend on z-index/elevation and measured screen geometry.
- The orange side/cart placeholder currently consumes taps but has no purchase/cart action yet. Its future behavior should probably display cart count and eventually trigger PayPal-backed checkout processing.
- The global rendered shadow plate is intentionally subtle. If button depth changes again, update `tappableButtonShadowPlate` once rather than changing individual buttons by hand.
- Do not add drop shadows to orange active nav portions or hairline-only dividers; earlier iterations showed that shadow/gray bleed can make inactive nav portions look active.
- If Expo tunnel fails again, separate `ngrok/exp.direct` tunnel health from Metro bundle health before assuming app code is broken.
- June 15 visual edits are pixel-sensitive. Future work on the Shop screen should preserve measurement constants and coupled style values unless the change explicitly targets that layout geometry.

Output Artifact

- Created this worklog PDF: `alla_vostra_worklog_june15.pdf`.
- No external PDF package was installed; this artifact was generated with a small standard-library PDF writer in the same plain-text-readable spirit as the prior daily worklogs.
