

Alla Vostra Mobile App Work Log - June 9, 2026

Compiled summary for June 9, 2026 - focus: brighter Home-screen mosaic imagery, portrait-oriented tile-blend image extensions, grouped scroll magnification timing, background opacity restraint, Shop-screen polish, and Android native navigation-bar color alignment.

Includes tracked Git work from the June 9 mobile-app session, local configuration checks, and the final clean repository status before producing this artifact.

Generated automatically for the June 9, 2026 daily worklog after the Android navigation-bar handoff.

Source Materials Processed

- Read existing root-level worklog PDFs, especially the June 6 part 1 and part 2 logs, to preserve the established filename convention, title wording, footer cadence, section order, and compact report style.
- Reviewed Git history for June 9, 2026, including commits 54dd4f8, da260ba, de2b94d, 30d3684, 46d651d, d55f29e, 3e8d11f, and fa3da51.
- Checked repository status before generation and confirmed the worktree was clean before adding this daily worklog artifact.
- Inspected the current Expo mobile configuration and package state while documenting the Android SDK 54 / Expo Go navigation-bar behavior.

Current Baseline to Preserve

- Primary development target remains /Users/prahlin/Desktop/alla_vostra/mob with Expo Router, Expo SDK 54, React Native 0.81.5, and Android/Expo Go as the key runtime target for this phase.
- Home now uses brighter, softer, more Italian-feeling mosaic imagery rather than the heavier Roman/gold direction from earlier variants.
- The active Home feature images are the tile-blend both variants, each retaining width while adding 50% vertical height for a more portrait-native mobile composition.
- Feature-section magnification is grouped by section: image, header, and paragraph resize together instead of each asset following independent timing.
- The Shop route has its own visual polish pass and the Android system navigation bar is configured to match the orange top-bar color.

Main Goals We Worked Toward

- Make Home imagery brighter, whiter, and better matched to the background1 visual language while keeping the mosaic identity intact.
- Extend Home mosaic assets vertically in a controlled way using appropriately sized tiles that blend unevenly into the cream page background.
- Refine vertical scroll behavior so image, header, and paragraph scaling feels intentional and synchronized as sections enter and leave view.
- Reduce background1 distraction during deep scroll states after the larger Home imagery became more visually dominant.
- Improve the Shop screen presentation and align native Android system chrome with the app header palette.

Work Completed - Home Image Mockups and Palette Direction

- Generated three brighter alternatives for each active Home mosaic image: taste111, convenience111, and passion111 families.
- Explored soft, cream, and Italian color directions, then applied the best-fitting variants to the Home screen for a lighter, less antique palette.
- Swapped the Passion soft variant for the Italian variant after comparing it against the app background and desired brand mood.
- Kept the exact source-image widths while producing new mockup files so layout math could stay stable around existing image containers.

Work Completed - Portrait Tile-Blend Image Extensions

- Discarded the earlier vertical-extension direction after it did not meet the visual target, then generated a simpler tile-blend approach based on the active mosaic images.
- Created top, bottom, and both-side tile-blend variants for Taste, Convenience, and Passion, adding randomly sized color tiles that gradually and unevenly blend toward the cream screen background.
- Applied the both variant for each Home feature image so the final assets gained 50% additional height while remaining visually connected to the original mosaic style.
- Adjusted the Home image sizing logic to remove horizontal gaps while preserving the new portrait aspect ratio.

Work Completed - Home Scroll Magnification and Typography

- Doubled the asset magnification strength on the Home screen and widened the active resizing ramp so sections begin growing earlier and diminish later while scrolling.
- Moved the timing model away from image-only behavior and toward section-level behavior, letting each image/header/paragraph group scale together.
- Fine tuned enter and exit anchors so a section can begin enlarging as its image comes into view while its exit timing remains tied to the paragraph leaving view.
- Increased Home header and paragraph line spacing by 50% to slow the reading rhythm and create a more spacious browsing experience.

Work Completed - Background and Shop Screen Polish

- Reduced the background1 image opacity low point during continued downward scrolling by 20%, lowering the distracting baseline behind content from the previous value.
- Cropped and optimized Shop supporting images, including truck1, bargain, and soflo, to improve fit and reduce awkward framing.
- Improved the Shop plus sign treatment, replaced the word "in" with an arrow, added a header before product offerings, and made multiple alignment and spacing refinements.
- Preserved the separate Shop route treatment while keeping its color language connected to the broader Alla Vostra mobile interface.

Work Completed - Android Navigation Bar and SDK 54 Runtime Path

- Installed and configured expo-navigation-bar so the native Android bottom system navigation bar can use the same orange as the top app bar: #f7b967.
- Added androidNavigationBar config in app.json with dark-content buttons and disabled contrast enforcement for the orange background.
- Added an Android-only runtime call in the root layout to set the navigation bar background and button style inside Expo Go.
- Confirmed Expo config resolves SDK 54.0.0 and clarified that the native Android navigation-bar color does not appear in web/browser previews.

Validation and Checks Performed

- Reviewed git log output for all June 9 commits and verified the chronological progression from image palette work through final Android nav-bar setup.
- Ran npx expo config --type public and confirmed sdkVersion 54.0.0 plus androidNavigationBar backgroundColor #f7b967 in the resolved public config.
- Confirmed package.json and package-lock.json contain expo-navigation-bar ~5.0.10 after installation.
- Attempted an Android export validation after the nav-bar change, but the Expo export process hung silently and was stopped rather than left running; config and dependency checks completed successfully.
- Confirmed repository status was clean before creating this worklog PDF.

Files Touched / Added During June 9 (from tracked commits)

- Modified app/layout/config files: mob/app/index.js, mob/app/_layout.js, mob/app.json, mob/package.json, and mob/package-lock.json.
- Modified shared behavior files: mob/components/CenterMagnifyView.js and mob/components/AppHeader.js.
- Modified Shop files/assets: mob/app/shop.js, mob/styles/shopStyles.js, mob/truck1.png, mob/bargain.png, and mob/soflo.png.
- Added brighter mockups for Convenience, Passion, and Taste in cream, Italian, and soft variants.
- Added tile-blend top, bottom, and both variants for the active Convenience, Passion, and Taste mosaic images.

Output Artifact

- Created this worklog PDF: alla_vostra_worklog_june9.pdf.
- No external PDF tool was installed; this artifact was generated with the same standard-library PDF approach used by the prior plain-text-readable worklog artifact.
