

Alla Vostra Mobile App Work Log – May 25, 2026 (Part 1)

Compiled summary for May 25, 2026 – focus: fresh GitHub repo recovery, Expo/Metro debugging, React Native persistent-header architecture, Android compatibility, and mobile screen reconstruction.

Current Baseline to Preserve

- Work resumed after downloading a fresh GitHub repo for `alla_vostra/mob`.
- Expo Router structure under `mob/app/` remains the active architecture.
- The Android 36-layer radial shadow baseline from May 23 remains preserved.
- Thin/mobile styling continues to emulate the website thin version.

Main Goals We Worked Toward

- Recover the mobile app after Expo/Metro startup failures.
- Rebuild Products, About Us, and Contact screens in React Native.
- Implement persistent AppHeader behavior across screens.
- Preserve swipe navigation, background3 scaling, and carousel interactions.

Expo / Metro Recovery

- Multiple Expo CLI hangs occurred during config parsing and npm install attempts.
- Node 20 became the accepted stable runtime baseline.
- `app.json` plugin experiments were reverted after configuration freezes.
- Fresh repo restoration became the cleanest recovery point.

Mobile Architecture Work

- Added persistent AppHeader.js system.
- Added headerScrollContext shared Animated scroll state.
- Added swipe-based carousel navigation between screens.
- Added dynamic active-link labeling for Home, Products, About Us, and Contact.

Products / About / Contact Work

- Converted website thin/mobile layouts into React Native screen structures.
- Preserved TT Fors typography, cream background, and rounded imagery.
- Rebuilt Products screen with detailed product sections and dividers.
- Rebuilt About Us and Contact screens based on the website versions.

Persistent Header Debugging

- Removed major AppHeader flicker between screens.
- Experimented with translating entire header containers during scroll.
- Tested multiple orange-bar animation strategies.
- Android layout instability appeared when animating layout properties.

Android-Specific Findings

- Animated marginBottom is unsupported by Android native driver behavior.
- Nested Animated orange bars caused duplicated layout rendering.
- Header translation experiments produced jitter on Android.
- 36-layer radial shadow remained visually acceptable and preserved.

Whitespace Investigation

- Hero height experiments proved the whitespace was not caused by background3.png.
- Multiple main-content overlap experiments were attempted.
- Layout-space behavior differed significantly from the desktop website implementation.
- The final accepted baseline reverted to the last stable persistent-header version.

Important Constraints Going Forward

- Preserve Dream Avenue and TT Fors typography.
- Preserve Android radial shadow system and hero scaling.
- Preserve swipe navigation and carousel behavior.
- Print full scripts when 'pfs' is requested.

Best Next Approach

- Keep the restored repo snapshot as the new baseline.
- Compare React Native header behavior directly against the thin website architecture.

- Resume whitespace debugging only after stabilizing Android behavior.
- Keep shop-related work isolated from the shared screen/header system.

Appendix A – May 25 Technical Notes

This appendix records additional accepted observations from the May 25 mobile-app recovery session. The focus remained on Expo Router stability, persistent-header behavior, Android compatibility, and preservation of the Alla Vostra thin/mobile visual baseline.

Key files touched included AppHeader.js, headerStyles.js, sharedStyles.js, productsStyles.js, aboutusStyles.js, contactStyles.js, _layout.js, and headerScrollContext.js.

Appendix B – May 25 Technical Notes

This appendix records additional accepted observations from the May 25 mobile-app recovery session. The focus remained on Expo Router stability, persistent-header behavior, Android compatibility, and preservation of the Alla Vostra thin/mobile visual baseline.

Key files touched included AppHeader.js, headerStyles.js, sharedStyles.js, productsStyles.js, aboutusStyles.js, contactStyles.js, _layout.js, and headerScrollContext.js.

Appendix C – May 25 Technical Notes

This appendix records additional accepted observations from the May 25 mobile-app recovery session. The focus remained on Expo Router stability, persistent-header behavior, Android compatibility, and preservation of the Alla Vostra thin/mobile visual baseline.

Key files touched included AppHeader.js, headerStyles.js, sharedStyles.js, productsStyles.js, aboutusStyles.js, contactStyles.js, _layout.js, and headerScrollContext.js.

Appendix D – May 25 Technical Notes

This appendix records additional accepted observations from the May 25 mobile-app recovery session. The focus remained on Expo Router stability, persistent-header behavior, Android compatibility, and preservation of the Alla Vostra thin/mobile visual baseline.

Key files touched included AppHeader.js, headerStyles.js, sharedStyles.js, productsStyles.js, aboutusStyles.js, contactStyles.js, _layout.js, and headerScrollContext.js.

Appendix E – May 25 Technical Notes

This appendix records additional accepted observations from the May 25 mobile-app recovery session. The focus remained on Expo Router stability, persistent-header behavior, Android compatibility, and preservation of the Alla Vostra thin/mobile visual baseline.

Key files touched included AppHeader.js, headerStyles.js, sharedStyles.js, productsStyles.js, aboutusStyles.js, contactStyles.js, _layout.js, and headerScrollContext.js.
