

Alla Vostra Work Log - May 30, 2026 Part 2

Scope

- Continued mobile visual refinement for the shared main screens (Home, Products, About Us, Contact).
- Finalized background image replacement workflow and vertical rhythm alignment around the top divider.

Work Completed

- Replaced main mobile hero image source from background3.png to background1.png in the shared header component.
- Increased hero vertical real estate to reduce top clipping and provide more visible headroom in the background scene.
- Iterated hero positioning so more of the upper image area appears under the top navigation region.
- Produced a dedicated comparison mockup page to evaluate tonal treatment before committing an asset replacement.
- Generated a new background mockup PNG focused on blending background3-like lighting and tone into the lower portion of background1.
- Replaced mob/background1.png with the approved blended mockup image.

Main Screen Divider and Spacing Adjustments

- Added larger vertical whitespace around the first divider so initial content appears only after slight downward scrolling.
- Increased divider spacing above and below by 50% for stronger separation and improved visual cadence.
- Standardized initial divider alignment across Home, Products, About Us, and Contact by replacing empty text-based spacers with fixed-height view spacers.
- Set consistent spacer height to eliminate per-screen text metric drift and keep divider placement visually identical during navigation.

Files Touched During Part 2

- mob/components/AppHeader.js
- mob/styles/headerStyles.js
- mob/background1-mockup.html
- mob/background1-mockup.png (generated)
- mob/background1.png (replaced with approved mockup)
- mob/styles/sharedStyles.js
- mob/styles/aboutusStyles.js
- mob/styles/contactStyles.js
- mob/styles/productsStyles.js
- mob/app/index.js
- mob/app/aboutus.js
- mob/app/contact.js
- mob/app/products.js

Outcome

- Main-screen entry state now has a stronger and more consistent top visual composition.
- Divider position is aligned across all main screens.

- First content assets are intentionally delayed in view until slight user scroll.
- Background image presentation is warmer and less harsh in the lower focal area while preserving the expanded vertical composition.
