

Alla Vostra Mobile App Work Log - October 4, 2026

Compiled summary for Sunday, October 4, 2026 - focus: verified U.S. Eastern-time date handling, full pre-existing worklog review, continuity from the September 24 App Store submission, iOS payment-method correction, PayPal browser-session recovery, simulator and physical-iPhone checkout validation, Stripe/Vercel environment alignment, EAS archive reduction and repair, successful iOS build 4 creation and upload, App Store Connect build replacement and resubmission, deployment-log establishment, snapshot refresh, and Git history cleanup for Alla Vostra.

Generated in continuity with the established Alla Vostra worklog cadence: compact opening summary, source-material review, baseline, goals, grouped work-completed sections, validation, files and artifacts touched, external account/device context, follow-up context, and output-artifact close.

This artifact is named `alla_vostra_worklog_october4.pdf` because the verified repository U.S. Eastern-time date used for generation was Sunday, October 4, 2026 at 1:33:25 AM EDT. The date is recorded in U.S. Eastern time rather than silently following UTC or a later calendar date elsewhere.

This PDF records the work window after `alla_vostra_worklog_september24.pdf` and documentation commit 4979f2a. It extends the project record through the iOS build 4 source and packaging commits, successful EAS build and submission, App Store Connect confirmation showing 1 Item Submitted and Waiting for Review, and commit ecc9812 establishing the repository deployment log and refreshed project snapshots.

Source Material Reviewed

- Reviewed all 69 pre-existing root-level Alla Vostra PDF worklogs from May, June, July, August, and September before drafting this October 4 artifact, preserving the established filename pattern, letter-size output, title cadence, opening-summary language, grouped work sections, validation style, artifact inventory, external-state context, follow-up cadence, and output-artifact close.
- Extracted the complete worklog set with pdftotext and confirmed the study pass covered 69 PDFs, 20,701 extracted lines, and 158,857 extracted words before this worklog was generated.
- Used `alla_vostra_worklog_september24.pdf` as the immediate continuity anchor because it documented App Store Connect metadata, screenshots, privacy publication, build 2 selection, and the first completed submission of App Store version 1.0.
- Rechecked the September 23 and September 17 worklogs as the nearest payment, TestFlight, Apple Pay, Google Pay, Stripe, Vercel, Google Play, physical-device, and production-release anchors needed to distinguish prior external state from the October 4 changes.
- Reviewed the current project snapshots, `DEPLOYMENT_LOG.md`, `read_project.sh`, App Store Connect screens supplied during the session, EAS build/submission records, recent Git history, and the exact mobile source/configuration files changed for build 4.
- Confirmed the latest report convention through pdfinfo and pdffonts: U.S. Letter pages, Helvetica and Helvetica-Bold, OpenAI Codex author metadata, Codex standard-library PDF generator creator/producer metadata, and established page footers.

Baseline Status Before October 4

- Android version 1.0.4, version code 5, was already approved and live on Google Play with Google Pay working through the approved Android integration; the user explicitly wanted that published Android binary left unchanged.

- App Store version 1.0 had previously been submitted with iOS 1.0.4 build 2. Apple's earlier binary-upload rejection for a missing camera purpose string had already been corrected in build 2, and NSCameraUsageDescription remained required in every later build.
- The iOS checkout still displayed Google Pay even though Google Pay is Android-only, and the PayPal redirect path could leave checkout marked as in progress when the browser was dismissed or the user manually returned to Alla Vostra.
- Apple Pay had previously succeeded through TestFlight and Stripe sandbox, but the new local release build needed fresh simulator and physical-device validation after the payment-flow changes.
- The repository did not yet have a dedicated operational record for EAS builds, store submissions, Vercel redeployments, payment-environment changes, or other external release events that are not fully represented by commit messages.

Goals for October 4

- Remove Google Pay from iOS without modifying the already-live Android binary or changing the Android Google Pay implementation.
- Replace the fragile iOS PayPal return wait with a supported browser authentication session that handles approval, cancellation, dismissal, and errors while preserving capture success.
- Verify Apple Pay and PayPal recovery on an iOS simulator and the connected USB iPhone, and diagnose any backend/account mismatch using direct Stripe and Vercel evidence.
- Produce a valid iOS 1.0.4 build 4, upload it to App Store Connect, replace the prior attached build, update App Review notes, and resubmit version 1.0.
- Create a durable deployment log, integrate it into the project-reading workflow, refresh the snapshots, and preserve the work in source control without recording secrets.

Work Completed - iOS Payment Method and PayPal Changes

- Changed the checkout wallet-method list in mob/app/shop.js to be platform-specific: iOS now shows Apple Pay and PayPal, Android continues to show Google Pay and PayPal, and card entry remains available separately on both platforms.
- Kept the Android Google Pay confirmation implementation, PlatformPay button, validation, and published Play Store package untouched; no Android build, upload, or rollout was performed.
- Updated mob/utills/paypalPayments.js so iOS opens PayPal with WebBrowser.openAuthSessionAsync rather than waiting only for a deep-link event from an external browser.
- Handled PayPal success URLs, explicit cancellation URLs, browser cancel results, browser dismiss results, and unexpected return states with immediate cleanup and a clear user-facing PayPal checkout was canceled message.
- Added expo-web-browser at the Expo SDK-compatible version and updated package.json and package-lock.json so the native dependency is reproducible in local and EAS builds.
- Incremented the iOS build number from 3 to 4 while keeping the public app version at 1.0.4, the bundle identifier at com.allavostra.app, and the Android version code at 5.

Work Completed - Simulator, iPhone, Stripe, and Vercel QA

- Built and launched the updated release app on the iPhone 17 Pro Max simulator and the connected physical iPhone 14 so the user could verify the changed checkout directly.
- Observed Apple Pay's simulated sheet correctly on the simulator and the native Wallet sheet on the physical iPhone, then investigated initial Payment not completed results rather than treating the native sheet display alone as payment proof.

- Used Stripe sandbox logs to isolate a 404 resource_missing response for PaymentIntent retrieval after successful token and PaymentMethod creation, proving that the mobile publishable key and backend secret key referenced different Stripe sandbox accounts.
- Guided correction of STRIPE_SECRET_KEY in the Vercel Production environment, distinguished a mistaken Preview-only update from the required Production entry, and retested after the user redeployed the backend. No secret value was printed or committed.
- Confirmed Apple Pay completed with Done and the Alla Vostra order-success screen on both the physical iPhone and simulator after the environment alignment; all iOS payment validation remained in Stripe sandbox/test mode and produced no real charge.
- Opened PayPal from the app, approved navigation to paypal.com, returned through the cancel path, and confirmed the app immediately reported PayPal checkout was canceled instead of remaining blocked for up to five minutes.
- Selected Apple Pay immediately after the PayPal cancellation and completed it successfully, proving the in-progress checkout state was cleared. The user also visually confirmed Google Pay was absent from iOS.

Work Completed - EAS Packaging, Build 4, and Submission

- Identified that the first EAS upload candidate was approximately 1.2 GB because the Git-root archive included repository-only media and generated content, then added a root .easignore to reduce the release upload.
- Used EAS build inspection to produce a roughly 51 MB initial filtered archive, then diagnosed failed build 67febb76-019b-48e7-b648-cdfc8cfaa482: required app-icon PNG configuration assets had been excluded from cloud prebuild.
- Reincluded the app icon, splash icon, and adaptive icon, reproduced a clean iOS prebuild, and confirmed the generated Info.plist retained NSCameraUsageDescription and the entitlements file retained merchant.com.allavostra.
- Diagnosed failed build 42728142-d5bf-4aa3-8bdc-eb0200b4029c after prebuild passed: unanchored root ignore names removed mob/styles/shopStyles.js and could remove mob/app/shop.js, causing Metro module resolution failure.
- Anchored repository-only exclusions to the repository root, audited tracked mobile files against the exact archive, and confirmed the active checkout source, styles, PayPal utility, icons, and splash assets were present.
- Discovered that local PayPal QA used mob/.env while the EAS preview environment initially contained only the three Stripe/merchant variables, then added the two public PayPal create-order and capture-order endpoint variables to EAS preview.
- Exported the exact audited archive locally with Metro: 1,522 modules and 48 active assets bundled successfully before the final cloud build was started.
- Completed EAS iOS build 8588d740-09c5-4008-b9c5-f10e4d19cb31 for app version 1.0.4, build 4, and produced the signed App Store IPA.
- Submitted that exact build with EAS submission 780661cf-9c04-4b23-88e2-c197f95a1e94; EAS reported the submission FINISHED for App Store Connect app 6815443745.

Work Completed - App Store Review Resubmission

- Rechecked build 4 against the prior Apple feedback and release pointers: Google Pay absent on iOS, PayPal cancel/dismiss recovery, Apple Pay usability after cancellation, the earlier camera purpose-string fix, and preserved merchant entitlement.
- Waited for Apple processing, removed the previously attached build 2 from App Store version 1.0, and selected version 1.0.4 build 4 in the Build section.

- Updated App Review notes to explain that build 4 no longer shows Google Pay on iOS, canceled or dismissed PayPal returns control immediately, Apple Pay/card/PayPal remain available, and no sign-in is required.
- Saved the updated version page, added the version for review, completed the final submission, and confirmed App Store Connect displayed 1 Item Submitted and status Waiting for Review.
- Clarified that Waiting for Review means Apple accepted the submission into the queue rather than approving it, and that the next reviewer decision is the final approval or rejection for App Store version 1.0.

Work Completed - Deployment Log, Snapshots, and Git History

- Added DEPLOYMENT_LOG.md as a durable newest-first operational record for builds, releases, store submissions, environment changes, validation evidence, failed attempts, known cautions, and follow-up work that commit messages do not fully capture.
- Seeded the log with the live Android 1.0.4 release, the September iOS build 1/build 2 history, the complete October build 4 trail, EAS build and submission IDs, external environment changes, and a reusable future-entry template.
- Updated read_project.sh so future app, deployment, payment-environment, and store-submission work must consult DEPLOYMENT_LOG.md, and included the log in generated root/tooling snapshot content.
- Regenerated alla_vostra_APP_PROJECT_SNAPSHOT.txt and alla_vostra_WEB_PROJECT_SNAPSHOT.txt with the current payment implementation and operational context.
- Reworded the iOS build 4 source commit to Prepared iOS build 4 for App Store resubmission with the requested detailed hyphen points, replayed the later packaging commit unchanged, and updated origin/main with force-with-lease because the prior hashes had already been pushed.
- Committed the deployment-log and snapshot work as ecc9812 Established deployment and release tracking; the working tree was clean and main matched origin/main before this PDF was created.

Validation and Checks Performed

- Verified the U.S. Eastern date locally with TZ=America/New_York date, which reported Sunday, October 4, 2026 at 1:33:25 AM EDT during this worklog generation pass.
- Extracted and reviewed all 69 prior root-level worklogs with pdftotext, totaling 20,701 lines and 158,857 words before this worklog was created.
- Confirmed the September 24 continuity anchor used six U.S. Letter pages, Helvetica and Helvetica-Bold, the established metadata fields, and the standard Alla Vostra page footer.
- Ran Expo Doctor after the build 4 dependency/configuration changes; all 18 checks passed.
- Ran a clean prebuild from the filtered archive and confirmed the camera purpose string and Apple Pay merchant entitlement in generated iOS files.
- Ran the exact filtered-archive Metro export successfully before the final EAS build, avoiding another cloud attempt with missing runtime source.
- Confirmed the final EAS build status FINISHED, the EAS submission status FINISHED, App Store Connect build 4 attachment, and the final Waiting for Review state.
- Confirmed the final Git state before PDF generation was clean at ecc9812 with main synchronized to origin/main.

Files and Artifacts Touched

- mob/app/shop.js - made wallet methods platform-specific so Google Pay is not rendered on iOS.
- mob/utls/paypalPayments.js - added Expo WebBrowser authentication-session handling and explicit success, cancellation, dismissal, and unexpected-return behavior.
- mob/package.json and mob/package-lock.json - added the Expo SDK-compatible expo-web-browser dependency.
- mob/app.json - incremented the iOS build number to 4 while preserving version 1.0.4.
- .easignore - reduced the EAS upload scope while retaining required mobile source, app icons, splash assets, and configuration inputs.
- DEPLOYMENT_LOG.md - added the current release snapshot, deployment history, operational cautions, build/submission IDs, validation evidence, and future-entry template.
- read_project.sh - required deployment-log review for release work and included the log in the root/tooling snapshot section.
- alla_vostra_APP_PROJECT_SNAPSHOT.txt and alla_vostra_WEB_PROJECT_SNAPSHOT.txt - regenerated after the payment, packaging, deployment-log, and project-reading changes.
- EAS preview, Vercel Production, Stripe sandbox, App Store Connect, and Apple App Review state - updated out of band as recorded above, with no secret values stored in the repository.

External Account, Store, Device, and Release Context

- Apple context: team 9966HFKD9U, App Store Connect app 6815443745, bundle identifier com.allavostra.app, merchant identifier merchant.com.allavostra, App Store version 1.0, and submitted binary 1.0.4 build 4.
- EAS context: project @prahlin1s-team/alla-vostra, testflight build profile using the preview environment, successful build 8588d740-09c5-4008-b9c5-f10e4d19cb31, and successful submission 780661cf-9c04-4b23-88e2-c197f95a1e94.
- Device context: iPhone 17 Pro Max simulator and connected physical iPhone 14 were used for the release checkout checks; Wallet/Apple Pay on the physical device and simulated Apple Pay both completed in Stripe sandbox mode after backend alignment.
- Android context: Google Play version 1.0.4, version code 5, remained approved and live. The October work did not create, install, upload, or submit another Android artifact.
- Payment context: the submitted iOS build is configured for Stripe sandbox/test behavior; no real iOS charge was created. The deployment log records the need to verify backend/account compatibility before payment-key rotation or public live-payment changes.

Follow-up Context

- Monitor App Store Connect and email for the transition from Waiting for Review to In Review, approval, rejection, or a request for additional information. Preserve exact reviewer text and screenshots before making any follow-up changes.
- If Apple approves version 1.0, confirm the desired automatic-versus-manual release behavior and the intended payment environment before the app becomes publicly available.
- Treat DEPLOYMENT_LOG.md as the operational source of truth for future builds, deployments, environment changes, store submissions, rollouts, and rollbacks; add new entries newest-first and never store secret values.
- Keep the current Google Play binary unchanged unless a separately planned Android release requires a new version code, new QA evidence, and a new Play Console rollout.
- Commit this October 4 PDF separately if preserving the established project convention of source/configuration commits followed by a documentation-only worklog commit.

Output Artifact

- Generated PDF: `alla_vostra_worklog_october4.pdf`.
- Location: repository root, alongside the existing Alla Vostra worklog PDFs from May through September.
- Title: Alla Vostra Mobile App Work Log - October 4, 2026.
- Subject: Alla Vostra October 4 2026 iOS build 4 payment fixes, device QA, EAS build, App Store resubmission, deployment logging, and release-readiness worklog.
- This artifact records the verified Eastern-time October 4 work window, the successful iOS build 4 and App Store resubmission, the complete QA/build-failure evidence trail, and the new deployment-history workflow through commit `ecc9812`.
