

Alla Vostra Mobile App Work Log - June 23, 2026

Compiled summary for Tuesday, June 23, 2026 - focus: app-header image separation, navigation smoothness, iOS layout and typography parity, header scroll-state behavior, swipe tuning, Shop preview scaling, and cart-overlay Add items affordance.

Generated automatically on June 24, 2026 after reviewing the recent root-level worklog PDFs, the June 23 Git commit chain, current mobile app source files, local parser checks, and the clean working tree state before this artifact was created.

Includes tracked Git work from commits 325b08e, 34b4721, 4e7327f, 539689a, 200b6b0, 4bdde5d, 2030f94, ca4ccbc, d984e6b, 0aa39ed, 6c9dada, and 0011f19, which together moved the Android-polished mobile app into a more complete and smoother iOS-compatible version.

Source Materials Processed

- Read the recent root-level PDF worklogs, especially June 18, June 19, and June 21, with pdftotext to preserve the established title cadence, compact summary opening, source-material section, baseline section, bullet-heavy work sections, validation section, follow-up context, and output-artifact close.
- Reviewed the June 23 Git history from commit 325b08e through 0011f19, including timestamps, commit messages, patch stats, and changed file lists for app-header image assets, navigation behavior, platform layout, iOS typography, Shop preview scaling, and cart-overlay action changes.
- Checked current source hotspots in mob/components/AppHeader.js, mob/styles/headerStyles.js, mob/components/MainScreenPushFrame.js, mob/utills/useMainScreenSwipeNavigation.js, mob/utills/platformLayout.js, mob/app/shop.js, and mob/styles/shopStyles.js.
- Confirmed the project root remains /Users/prahlin/alla_vostra and the active mobile app remains under /Users/prahlin/alla_vostra/mob.
- Confirmed the working tree was clean before creating this artifact, so the implementation state described here reflects the committed June 23 baseline before this PDF was added.
- Used find, pdfinfo, pdftotext, git log, git show --stat, git status, rg-oriented source inspection, node --check history, git diff --check history, and a small standard-library PDF writer; no external PDF package was installed.

Current Baseline to Preserve

- Primary app work remains in /Users/prahlin/alla_vostra/mob, with Expo Router and React Native as the mobile runtime surface.
- Android remains the practical visual reference for the main screens, header behavior, Shop preview layout, and cart overlay, while June 23 concentrated on making iOS match that look and feel more closely.
- The shared main-screen header now uses a no-cheeseboard background image and a separate cheeseboard_products.png foreground asset, allowing the cheeseboard to animate independently of the room/table background.
- Main screen navigation now snaps content immediately instead of showing a split push-in/push-out state. The cheeseboard foreground animation carries the directional transition cue after the main screen itself changes.
- The iOS header, screen-name links, chevrons, Shop button, scroll fade, and orange indicator region have been platform-tuned and should be treated as delicate visual alignment work.
- Shop and cart overlay behavior continues to use the established orange/cream visual system, premium green shopping actions, and local front-end cart flow. Checkout remains visual-only.

Main Goals We Worked Toward

- Separate the app-header cheeseboard from the background image so it can become its own reusable, directional transition asset without degrading the room/table background.
- Remove navigation stutter by eliminating the visible two-screen push effect and avoiding expensive or unsupported header-image resizing during screen changes and vertical scrolling.

- Make the iOS build substantially closer to Android across safe-area behavior, top-bar typography, horizontal and vertical alignment, line heights, and swipe behavior.
- Stabilize the header scroll transition so the no-cheeseboard image and cheeseboard foreground fade into the background role smoothly as main content scrolls downward.
- Tune iOS vertical scrolling and horizontal swiping so browsing content does not accidentally trigger navigation, while deliberate screen swipes still work over images, headings, and text.
- Make the iOS Shop preview fit comfortably on screen with Android-like proportions, then simplify the cart overlay Add items path by reusing the main green action button.

Work Completed - Header Image Asset Separation

- Added mob/background1_no_cheeseboard.png as the main header background image without the cheeseboard sitting on the table.
- Added mob/cheeseboard_products.png as a separate foreground product asset, preserving the rounded/oval cheeseboard look and allowing it to be animated independently of the background.
- Updated the app header so the Home and other main screens use the no-cheeseboard background while the foreground cheeseboard can slide during navigation.
- Kept the original background1.png available as the untouched source/reference asset while the no-cheeseboard variant became the active main-screen header background.
- Adjusted the compositing approach after image edits so the empty tablecloth area no longer showed a white rectangle, odd outline, or rounded board remnant at the bottom edge.

Work Completed - Main Screen Navigation Smoothness

- Disabled the visible push-in/push-out effect between main screens so two screens no longer appear simultaneously during horizontal drag.
- Changed MainScreenPushFrame behavior so the destination screen snaps in immediately, which made route changes feel substantially snappier on device.
- Preserved a directional transition signal by letting the cheeseboard_products asset slide instead of relying on the full screen surface moving across the viewport.
- Made the cheeseboard slide direction depend on the user swipe direction rather than playing a single fixed left-to-right animation for every navigation event.
- Stopped the cheeseboard transition from running in the header new/faded state, where the foreground movement was less useful and more likely to look unstable.

Work Completed - Header Scroll State and Image Behavior

- Removed resizing and repositioning of the no-cheeseboard image during vertical scrolling after those transformations were identified as a major source of jank and visual mismatch.
- Kept the no-cheeseboard background visually anchored below the orange nav indicator region while preserving enough vertical image content to show important top details such as the ceiling lamps.
- Moved the cheeseboard foreground upward so it visually straddles the bottom edge of the no-cheeseboard background image, roughly bleeding above and below that boundary.
- Fixed the iOS old-to-new header transition so the top orange bar and indicator region expand toward the new state without compressing the established old state.
- Removed the strange high-opacity horizontal block below the top nav bar during scroll transitions, allowing the no-cheeseboard image to appear normally in that area.
- Implemented the iOS screenfade effect so the no-cheeseboard background and cheeseboard foreground lower in visibility during continued downward scrolling like the Android version.
- Avoided unsupported native animated height changes after the height property produced a native animated module error, keeping scroll-driven effects on safer animated properties.

Work Completed - iOS Navigation Bar Alignment and Typography

- Introduced broader iOS layout handling so safe areas, header spacing, top orange bar placement, and screen content alignment are no longer Android-only assumptions.
- Adjusted the screen/link names in the top nav bar through several passes so their vertical position is centered relative to the orange indicator area and no longer disappears or sits too low.
- Adjusted the Shop button placement and typography on iOS, including making the SHOP label bolder and aligning it with the surrounding top-bar assets.
- Reduced the Alla Vostra iOS brand text size across several passes, prevented it from line-wrapping, and horizontally centered it within the left half of the orange bar.
- Matched the iOS top orange empty gap more closely to Android, then refined vertical centering between Alla Vostra and the Shop button so the brand bar reads as one coherent system.
- Increased the Android Alla Vostra font size by 2px where needed so the two platforms remain balanced rather than only shrinking the iOS presentation.

Work Completed - iOS Compatibility Pass

- Moved the Android-ready app into an early working iOS-compatible state by adjusting app layout, main screen spacing, body typography, line heights, and component positioning across the mobile project.
- Added platform layout helpers so iOS-specific sizing and positioning can be expressed deliberately instead of scattering one-off platform checks through unrelated code.
- Adjusted Home, Products, About Us, and Contact screen files and style modules to reduce font-size drift, line-height mismatch, and horizontal/vertical alignment issues on iOS.
- Loaded and exposed the TT Fors Demibold font so Shop preview boxes and action buttons can better match the desired Android visual weight on iOS.
- Kept Android behavior intact while adding iOS-specific layout corrections, avoiding a broad redesign of the already-accepted Android version.

Work Completed - Swipe and Scroll Tuning

- Increased iOS vertical scroll responsiveness so the effort needed to move through main-screen content feels closer to Android.
- Reduced horizontal swipe sensitivity on iOS so users are less likely to navigate left or right by mistake while trying to browse vertical content.
- Adjusted the horizontal threshold back toward an in-between value after swiping became too hard, preserving deliberate navigation without making accidental swipes too easy.
- Fixed the issue where horizontal swiping was difficult or inconsistent when the touch began on main content images, making swipe behavior more uniform across images, headers, and paragraphs.
- Kept the snapped screen-transition model in place after it proved much smoother than the previous push animation, then repaired the cheeseboard animation independently.

Work Completed - Main Screen Text Sizing

- Reduced iOS header font sizes and paragraph font sizes across the main screens by 2px so the content reads closer to the Android version.
- Adjusted shared, products, about, and contact style modules so text scale and line spacing are less oversized on iOS.
- Kept the main content changes focused on platform parity rather than changing copy, screen order, or the accepted Android visual hierarchy.

Work Completed - Shop Preview iOS Layout

- Scaled down the Shop preview assets on iOS so the preview screen fits comfortably on device without requiring scrolling.
- Reduced the Deliciousness awaits text dramatically, then increased image and text-box scale after the preview became too small, landing on a more balanced Android-like composition.
- Updated the preview box labels to read 12 hour shipping and M. Dade Broward, preserving the intended line wrapping and matching the font size of the three boxes.
- Increased iOS font weight for the three preview boxes, then backed it down to an in-between value when it became too heavy.
- Increased top and bottom padding in the preview boxes through multiple passes so the labels feel centered and substantial rather than squeezed.
- Matched the Im ready action text to the preview box font family and weight, then reduced it by small increments for better fit.
- Vertically aligned the Im ready button with the sticky cart button, matched its height to the cart button, and tuned its width so the horizontal gap to the cart matches the cart-to-screen-edge gap.
- Adjusted the white triangle inside the Im ready button through several passes until it aligned visually with the text like the Android version.

Work Completed - Cart Overlay Add Items Action

- Removed the separate Add items button from cart screen layouts on both Android and iOS, including empty-cart and populated-cart states.
- Changed the existing Go back action to become a green Add items action while the cart overlay is visible, keeping the product-selection return path in the main action slot.
- Kept the green Add items action connected to the existing product-overlay return behavior, so users who enter cart view can move back into item selection without closing the whole Shop experience.
- Inserted a white triangle to the left of Add in the Add items action button, matching the vertical triangle height used by the Im ready button family.
- Preserved the previous Go back behavior for product-overlay context while changing the label, color, and action only when the cart overlay is active.

Validation and Checks Performed

- Ran node --check mob/app/shop.js after the Shop preview, cart action, and overlay interaction changes.
- Ran node --check mob/styles/shopStyles.js after the Shop preview sizing, typography, ready-button, cart-action, and triangle style changes.
- Ran git diff --check after the recent implementation work; no whitespace or patch-format issues were reported.
- Ran Expo web export checks during the June 23 implementation cycle to catch bundling problems after larger navigation/header and Shop changes.
- Reviewed June 23 commit stats and source hotspots before generating this artifact to keep the worklog aligned with the actual committed implementation rather than stale intermediate adjustments.
- Confirmed the working tree was clean before creating this June 23 PDF artifact.

Files Touched / Added During June 23

- Header image assets: mob/background1_no_cheeseboard.png and mob/cheeseboard_products.png.
- Main app and screen files: mob/app/_layout.js, mob/app/index.js, mob/app/products.js, mob/app/aboutus.js, mob/app/contact.js, and mob/app/shop.js.
- Header/navigation components: mob/components/AppHeader.js, mob/components/MainScreenPushFrame.js, mob/components/CenterMagnifyView.js, and mob/components/ScreenFade.js.

- Style modules: mob/styles/headerStyles.js, mob/styles/sharedStyles.js, mob/styles/productsStyles.js, mob/styles/aboutusStyles.js, mob/styles/contactStyles.js, mob/styles/shopStyles.js, mob/styles/stickyCartStyles.js, and mob/styles/typography.js.
- Navigation/layout utilities: mob/utls/headerSwipeContext.js, mob/utls/mainScreenScrollContext.js, mob/utls/platformLayout.js, and mob/utls/useMainScreenSwipeNavigation.js.
- This final worklog generation creates alla_vostra_worklog_june23.pdf at the repository root.

Important Follow-Up Context

- The snapped main-screen transition is now intentional. Future work should avoid reintroducing a full-screen push animation unless it is known not to degrade navigation smoothness.
- The no-cheeseboard background and cheeseboard foreground are now separate assets. Header changes should preserve that split so the background does not need to be regenerated for every foreground-motion adjustment.
- The iOS header remains visually sensitive: small changes to safe area, orange indicator position, font size, or transform math can make the nav names, Shop button, or background image appear clipped or misaligned.
- Swipe tuning is deliberately conservative on iOS to avoid accidental route changes while browsing vertical content. Any future threshold changes should be tested on text, images, and scrollable areas.
- The Shop preview iOS layout is heavily tuned around fitting all assets on screen. Future copy or asset changes should be checked against the sticky cart button, Im ready button, and bottom margin together.
- Checkout remains visual-only. June 23 improved item acquisition and cart-return affordances but did not connect payment, backend order storage, or delivery scheduling.

Output Artifact

- Created this worklog PDF: alla_vostra_worklog_june23.pdf.
- No external PDF package was installed; this artifact was generated with a small standard-library PDF writer in the same plain-text-readable spirit as the prior daily worklogs.
