

Alla Vostra Mobile App Work Log - June 25, 2026

Compiled summary for Thursday, June 25, 2026 - focus: Delivery overlay form expansion, state dropdown behavior, Shop overlay step navigation, cart-to-confirmation order flow, iOS parity for the Android-polished Shop screens, forward-button gating, sticky-cart confirmation state, empty-cart text centering, and responsive bottom action-button geometry.

Generated automatically on June 26, 2026 after reviewing the recent root-level worklog PDFs, the June 25 Git commit chain, current mobile source files, refreshed project snapshots, local parser/whitespace checks, and the clean working tree state before this artifact was created.

Includes tracked Git work from commits 986cc3b, 9144688, fd2e874, f22bb53, c2506d4, 387d361, 2b043bf, 68cae9f, and 33646db. Together these commits turned the visual checkout path into a fuller Products, Cart, Delivery, Payment, and Confirmed sequence, then carried the Android work across to iOS and tightened the bottom navigation controls.

Source Materials Processed

- Read recent root-level PDF worklogs, especially June 21, June 23, and June 24, with pdftotext to preserve the established title cadence, compact summary opening, source-material section, baseline section, bullet-heavy work sections, validation section, follow-up context, and output-artifact close.
- Reviewed the June 25 Git history from commit 986cc3b through 33646db, including timestamps, commit messages, changed files, and patch stats for delivery form work, overlay navigation buttons, confirmation flow, iOS parity, forward-button gating, and responsive bottom-button geometry.
- Checked the refreshed snapshots alla_vostra_APP_PROJECT_SNAPSHOT.txt and alla_vostra_WEB_PROJECT_SNAPSHOT.txt, both generated Thursday, June 25, 2026 at 10:07 EDT, confirming the active mobile project remains /Users/prahlin/alla_vostra/mob.
- Inspected source hotspots in mob/app/shop.js, mob/styles/shopStyles.js, mob/components/StickyCartButton.js, mob/styles/stickyCartStyles.js, mob/utills/shopCartContext.js, and mob/app/_layout.js.
- Confirmed the June 25 implementation chain touched the mobile Shop implementation, Shop styles, sticky cart component and styles, shared cart context, and the root project snapshots. The June 24 worklog artifact was also created at the beginning of the day.
- Used git log, git show --stat, git diff --stat, git status, rg, sed, pdftotext, pdftinfo, node --check, git diff --check, repeated Expo platform exports from the implementation cycle, and a small standard-library PDF writer; no external PDF package was installed.

Current Baseline to Preserve

- Primary app work remains in /Users/prahlin/alla_vostra/mob, using Expo Router and React Native as the mobile runtime surface.
- The Shop path now has a fuller front-end order sequence: Products, Cart, Delivery, Payment, and Confirmed. The bottom center button names the current overlay, while left and right triangle buttons navigate backward and forward through the sequence.
- Checkout remains visual/front-end only. June 25 added form fields, payment choices, prompts, and confirmation screens, but did not add a backend order endpoint, real payment processing, delivery dispatch, persistence, or production validation.
- Android remains a major visual reference for the Shop/cart experience, but June 25 also moved a large portion of the Android-polished work onto iOS. Future refinements should be

checked on both platforms unless a request is explicitly platform-only.

- The sticky cart remains a global signal. It normally shows the cart icon and quantity badge, but after confirmed order placement it becomes a green checkmark button without the quantity bubble.
- The lower Shop action cluster is now delicate. Its center button width, side triangle button width, fixed 10px overlap, and sticky-cart spacing are all interdependent and should be adjusted together rather than with isolated margins.

Main Goals We Worked Toward

- Turn the Delivery overlay from a simple placeholder into a real-looking delivery-address and contact-information form with state selection, zip, email, phone, field activity states, and Florida-only messaging.
- Replace the single ambiguous center action button with an explicit step-navigation system that clearly communicates the overlay order and gives users left/right movement through the order flow.
- Add a confirmation step that makes order placement feel intentional: Place order opens a prompt, No cancels, Yes advances to the final Confirmed overlay, and only that final state changes the sticky cart into a green checkmark.
- Apply the substantial Android Shop overlay, cart, delivery, payment, confirmation, button, and asset work to iOS without leaving out the truck image, bargain image, overlay controls, or sticky-cart state.
- Make forward triangle buttons communicate disabled state correctly: low visibility when the cart is empty or the user has not unlocked a step, no trigger action while dimmed, and no translucent bleed that lets center-button assets show underneath.
- Keep the center button horizontally centered while responsive geometry manages triangle-button overlap, sticky-cart spacing, narrow-screen pressure, and iOS label sizing.

Work Completed - June 24 Artifact and Snapshot Refresh

- Created `alla_vostra_worklog_june24.pdf` early on June 25 as the formal PDF record for the prior day of iOS Shop parity, overlay dimming, delivery/payment placeholder screens, filled-cart layout, and cart action work.
- Regenerated the root project snapshots after the large Delivery overlay implementation began, updating `alla_vostra_APP_PROJECT_SNAPSHOT.txt` and `alla_vostra_WEB_PROJECT_SNAPSHOT.txt`.
- Preserved the established root-level PDF naming convention and used the June 24 PDF as the closest style reference for this June 25 artifact.
- Kept the snapshot refresh separate from mobile source behavior: the snapshots changed substantially by line count because they are generated records of the current project tree and source state.

Work Completed - Delivery Overlay Form Expansion

- Changed the Delivery overlay State field from a text input into a dropdown menu containing U.S. states, Washington, D.C., and U.S. territories.
- Refined dropdown behavior across multiple passes: it opens downward, allows vertical up/down scrolling, supports tap-and-drag browsing through options outside the initially visible region, keeps the state names non-bold, and closes when tapping outside.

- Changed state display values from full state/territory names to official abbreviations such as FL and NY, with the default placeholder renamed from Select to --.
- Added a red, tiny, capitalized, left-aligned message under the state field when the selected value is anything other than FL: Only Florida deliveries available at this time.
- Narrowed and resized the state/zip row several times, landing on a City field that matches the First name width and a remaining right-hand row split between State and Zip.
- Inserted a Zip field to the right of State, then added Email and Phone # rows below the delivery address block.
- Renamed Apartment/House # to Suite/Unit # and removed the colon only from the Delivery Address heading after the broader colon-removal request was narrowed.
- Added a Contact info heading above Email, then placed the truck image in the lower-right empty space beside the half-width Email and Phone # fields.

Work Completed - Delivery Field States and iOS Delivery Parity

- Tuned delivery form field coloring so fields are gray when inactive and empty, but turn plain white when active, when the cursor is present, when the state/province is picked, or when any text has been entered.
- Improved tap-area isolation between fields after tapping sometimes flickered focus between neighboring inputs.
- Restored ordinary text-input behavior for all non-State fields so they show the vertical blinking cursor while awaiting input and actual characters/numbers after data entry, matching the Street field behavior.
- Reduced or removed the heavy field drop shadow, then brought inactive fields back as a lighter in-between gray rather than all-white or overly dark gray.
- Adjusted the vertical gaps around Delivery Address, the first form row, Contact info, Email/Phone, and the top orange banner so the overlay spacing feels deliberate and consistent.
- Applied iOS-specific delivery refinements after the Android layout was accepted: delivery overlay font sizes reduced by 2 points on iOS, iOS field heights reduced by 20 percent, and the truck image vertically centered between Email top and Phone bottom.
- Kept Android as-is where explicitly requested, while making later shared delivery changes apply to both Android and iOS.

Work Completed - Step Navigation Buttons

- Introduced white left and right triangle buttons around the center button on Shop overlay screens, then iterated through size, width, padding, corner rounding, and triangle placement.
- Moved left-facing triangles into the left side button and right-facing triangles into the right side button, then horizontally centered each triangle inside its button.
- Renamed the center-button sequence through the requested language changes: Benefits became Selection, then Products; Add items became Cart; the Delivery overlay button became Delivery; the Payment overlay button became Payment; Confirmation became Confirmed.
- Changed the center button role so it names the current overlay rather than being the only action trigger. Navigation is now handled by side arrow buttons in the Products, Cart, Delivery, Payment, Confirmed order.
- Removed horizontal gaps between side arrow buttons and the center button, then changed the side buttons to orange with white triangles.
- Let the triangle buttons bleed horizontally into the center button, then later reworked

that geometry so the bleed is fixed at 10px and center button width responds to screen pressure.

- Added thin orange top and bottom bands to the white center buttons, including hairlines separating the orange bands from the white center, echoing the overlay window frame language.

Work Completed - Order Flow, Prompt, and Confirmed Overlay

- Mapped right-arrow navigation so Products advances to Cart, Cart advances to Delivery, Delivery advances to Payment, and Payment advances to the final Confirmed overlay.
- Mapped left-arrow navigation so Cart returns to Products, Delivery returns to Cart, Payment returns to Delivery, and Confirmed returns to Payment, preserving the left-to-right overlay order.
- Copied the Checkout-style button into the Payment overlay, renamed it Place order, and made it open an in-overlay prompt rather than immediately changing screens.
- Built the prompt flow inside Payment: the box asks Are you sure you want to place an order with Alla vostra? with Alla vostra on a separate line, Yes uses green with white text, and No uses red with white text.
- Made No close the prompt and restore the Payment overlay to the exact pre-prompt look.
- Made Yes advance to the Confirmed overlay while keeping the Payment assets and center button intact until that explicit confirmation occurs.
- Filled the Confirmed overlay with the final message area, doubled margins, matched the message font properties to the empty-cart text style, removed the Thank you for shopping with snippet, and inserted the bargain image instead.
- Increased the bargain image size by 50 percent and kept it horizontally centered in the final confirmed state.
- Changed the sticky cart only after final confirmation: it becomes green with a fat white checkmark of cart-icon scale and removes the quantity bubble.

Work Completed - iOS Parity for Shop Screens

- Applied the large Android Shop-screen changes to iOS as requested, including preview screen behavior, arrow buttons, center buttons, sticky cart confirmation state, cart/delivery/payment/confirmed overlays, forms, prompt boxes, text, and asset alignment.
- Brought the Delivery contact block onto iOS with the Contact info heading, half-width Email and Phone # fields, and the truck image sized and centered in the right-side gap.
- Preserved Android when the user explicitly called out iOS-only changes, especially delivery font-size reduction, field-height reduction, and truck vertical centering.
- Adjusted iOS center button label font size downward by 2 points after the responsive button geometry made label fit more sensitive.
- Kept repeated iOS and Android Expo exports passing during the parity work so the shared source changes continued to bundle for both platforms.

Work Completed - Forward Button Visibility and Gating

- Added low-visibility forward/right-triangle button behavior for steps that should not yet be accessible.
- Excluded Products from one early visited-step gating pass, then refined the Products right arrow so it restores visibility only once at least one item has been added to the cart.
- Disabled trigger actions for all low-visibility right triangle buttons so a dimmed arrow

cannot advance the flow invisibly.

- Strengthened the gate so right triangle buttons stay low visibility and inert until the cart contains at least one billable item and the real Checkout button has been tapped at least once since app load.
- Made the empty-cart rule absolute: if the cart is empty, the right triangle remains low visibility regardless of prior Checkout taps or visited overlay state.
- Prevented center-button assets from showing underneath low-visibility triangle buttons by replacing opacity-based dimming with opaque muted colors.
- Changed the dimmed right triangle treatment from orange-brown toward neutral gray: darker/then brighter neutral shadow, grayish border, muted orange body, and softened triangle color while remaining fully opaque.

Work Completed - Empty Cart and Responsive Bottom Geometry

- Vertically centered the empty-cart message in the visible cream area of the cart overlay by giving the empty-state container a responsive height rather than relying on absolute fill inside a ScrollView.
- Nudged the Your line upward on Android only after the centered empty-cart text needed a small platform-specific correction.
- Reworked bottom action-button geometry so the center button remains horizontally centered and the triangle buttons retain a fixed 10px overlap into the center button.
- Changed the center button width to respond to screen width and sticky-cart spacing instead of changing the triangle-button bleed.
- Set the right-triangle-to-sticky-cart gap target to match the sticky cart button-to-right-edge screen margin, 18px. On very narrow screens, the center button stops shrinking at its minimum readable width, so the gap may get smaller but should not grow larger.
- Kept the center button label padding responsive so labels can still fit after width changes, with `adjustsFontSizeToFit` still available as a final guard.

Validation and Checks Performed

- Freshly ran `node --check mob/app/shop.js` before generating this artifact.
- Freshly ran `node --check mob/styles/shopStyles.js` before generating this artifact.
- Freshly ran `node --check mob/components/StickyCartButton.js` before generating this artifact.
- Freshly ran `node --check mob/styles/stickyCartStyles.js` before generating this artifact.
- Freshly ran `node --check mob/utils/shopCartContext.js` before generating this artifact.
- Freshly ran `node --check mob/app/_layout.js` before generating this artifact.
- Freshly ran `git diff --check` before generating this artifact; no whitespace or patch-format issues were reported.
- Confirmed the working tree was clean before creating this June 25 PDF artifact.
- During the June 25 implementation cycle, repeatedly ran `npx expo export --platform ios` and `npx expo export --platform android` after major Shop, overlay, field, sticky-cart, and button-geometry changes.
- Managed low available disk space during repeated exports by clearing temporary `/tmp/alla-vostra-*` export folders after successful bundle checks.

Files Touched / Added During June 25

- Generated prior-day worklog artifact: `alla_vostra_worklog_june24.pdf`.
- Refreshed project snapshots: `alla_vostra_APP_PROJECT_SNAPSHOT.txt` and `alla_vostra_WEB_PROJECT_SNAPSHOT.txt`.
- Primary Shop implementation and flow state: `mob/app/shop.js`.
- Primary Shop visual styling, delivery form styling, overlay styling, center/triangle button geometry, empty-cart centering, and platform typography: `mob/styles/shopStyles.js`.
- Sticky cart confirmation state and checkmark rendering: `mob/components/StickyCartButton.js`.
- Sticky cart confirmation styling: `mob/styles/stickyCartStyles.js`.
- Shared cart and order-confirmation overlay state: `mob/utils/shopCartContext.js`.
- This final worklog generation creates `alla_vostra_worklog_june25.pdf` at the repository root.

Important Follow-Up Context

- The Delivery, Payment, and Confirmed overlays remain front-end UI only. They still need real validation, address persistence, phone/email validation, order storage, payment integration, and delivery availability enforcement before production use.
- The State dropdown includes U.S. states, Washington, D.C., and U.S. territories, but the business rule currently communicates that only Florida deliveries are available. Future checkout validation should enforce the same rule, not only display it.
- The forward-arrow gating is intentionally conservative. Future navigation changes should preserve the idea that users cannot advance with an empty cart or through unvisited/unconfirmed steps via dimmed arrows.
- The opaque dimmed triangle-button treatment exists to avoid center-button artwork bleeding underneath. Do not replace it with wrapper opacity unless the overlap geometry is also changed.
- The bottom action cluster is now mathematically tied to `stickyCartEdgeOffset`, `stickyCartButtonSize`, side-button width, fixed 10px overlap, and center-button minimum width. Future adjustments should be tested on narrow iOS and Android widths.
- The confirmation sticky-cart checkmark is tied to the final confirmed overlay state, not merely tapping Place order. Future order-flow changes should preserve that timing so the cart does not look completed before the user confirms.
- Several iOS delivery and button values are explicitly platform-specific. Android should remain untouched when a future request says iOS only, and shared requests should be checked on both platforms.

Output Artifact

- Created this worklog PDF: `alla_vostra_worklog_june25.pdf`.
- No external PDF package was installed; this artifact was generated with a small standard-library PDF writer in the same plain-text-readable spirit as the prior daily worklogs.
