

Alla Vostra Mobile App Work Log - September 23, 2026

Compiled summary for Wednesday, September 23, 2026 - focus: verified U.S. Eastern-time date handling, full pre-existing worklog review, project-context continuation, Apple Developer and EAS credential setup, iOS TestFlight build repair after Apple Info.plist rejection, physical iPhone 14 and large iOS simulator testing, TestFlight installation, Apple Pay merchant and Stripe iOS certificate configuration, successful sandbox Apple Pay checkout, Stripe webhook and Postmark email repair, Vercel production environment alignment, backend raw-body signature verification hardening, confirmation of merchant and customer order emails, Android current-package build verification, disk-space recovery for local native builds, and current documentation artifact generation for Alla Vostra.

Generated in continuity with the established Alla Vostra worklog cadence: compact opening summary, source-material review, baseline, goals, grouped work-completed sections, validation, files and artifacts touched, external account/device context, follow-up context, and output-artifact close.

This artifact is named `alla_vostra_worklog_september23.pdf` because the verified repository U.S. Eastern-time date used for generation was Wednesday, September 23, 2026. The Eastern date was checked locally with TZ=America/New_York date, which reported Wednesday, September 23, 2026 at 10:53:13 PM EDT during the generation window. The date is recorded in U.S. Eastern time rather than silently following UTC or a later calendar date elsewhere.

This PDF records the work window after `alla_vostra_worklog_september17.pdf` and documentation commit 7ed77b7, through source commit b0f167e Prepared iOS TestFlight payments and repaired Stripe webhooks, plus the subsequent local Android release-APK build verification that was completed without installing or opening the app on the Galaxy device.

Source Material Reviewed

- Reviewed all 67 pre-existing root-level Alla Vostra PDF worklogs from May, June, July, August, and September before drafting this September 23 artifact, preserving the established naming pattern, letter-size PDF output, title cadence, opening summary, source-review wording, grouped implementation sections, validation language, files/artifacts inventory, device/account context, follow-up cadence, and output-artifact close.
- Extracted the complete root-level worklog set with pdftotext and confirmed the study pass covered 67 PDFs, 20,061 extracted text lines, and 152,910 extracted words before this worklog was generated.
- Used `alla_vostra_worklog_september17.pdf` as the immediate continuity anchor because it documented the Google Pay approval, Android Play release promotion, synchronized iOS visual QA, reusable XCTest harness, snapshot refresh, and current report style inherited by this session.
- Rechecked `alla_vostra_worklog_september15.pdf` and `alla_vostra_worklog_september12_part1.pdf` as the nearest payment/backend/testing style anchors because today's work depended on Stripe, Postmark, Vercel, Google Pay, Android native builds, Expo, iOS device testing, and the project's distinction between local QA and store-distributed binaries.
- Reviewed the latest Git history and repository status, including documentation commit 7ed77b7 and source commit b0f167e, and confirmed the working tree was clean before this PDF artifact was created.
- Reviewed changed source/config surfaces from the September 23 source commit: `mob/app.json`, `mob/eas.json`, `server/api/stripe-webhook.js`, `server/test/postmark.test.js`, `server/test/stripe-webhook.test.js`, and the regenerated `app/web` snapshot files.
- Reviewed generated and runtime artifacts relevant to the session, including the current Android release APK metadata, Stripe sandbox PaymentIntent metadata, Vercel deployment logs,

TestFlight build state, Apple Pay certificate configuration, and Postmark email-delivery evidence supplied through the user inbox.

Baseline Status Before September 23

- Android production 1.0.4 and Google Pay approval work had already been documented, but the immediate session goal shifted toward preparing and testing the iOS App Store/TestFlight path without compromising the Android app's look, functionality, or submitted release posture.
- The iOS interface was considered usable enough for TestFlight, but App Store Connect had not yet accepted a corrected binary and Apple Pay had not yet been fully verified through the physical iPhone sandbox flow.
- The app already depended on Stripe and Postmark backend paths for order capture and email confirmation, so payment success alone was not sufficient; webhook delivery, merchant notification, and customer confirmation also needed verification.
- The repository contained generated native Android and iOS directories, Expo/EAS configuration, serverless Vercel backend code, Postmark email templates, Stripe webhook handling, and root-level project snapshots that are intentionally refreshed by `read_project.sh`.
- The connected physical iPhone 14 and connected Galaxy device were available for USB debugging, while a large iOS simulator was needed for current-device coverage and Android current-package verification needed to avoid disrupting the phone until explicitly approved.

Goals for September 23

- Set up the Apple Developer, EAS, App Store Connect, and TestFlight lane enough to produce a valid iOS beta binary for `com.allavostra.app`.
- Correct Apple's missing camera purpose-string rejection without changing Android behavior or altering the submitted Android app experience.
- Install and launch the TestFlight build on the physical iPhone, then verify Apple Pay against Stripe sandbox with a real Wallet card presentation but no real charge.
- Configure the Stripe Apple Pay iOS certificate and merchant identifier path so the native Apple Pay sheet can complete an order from TestFlight.
- Diagnose why successful Stripe payments were not producing order emails, repair webhook signing and environment alignment on Vercel, and prove both merchant and customer emails arrive.
- Confirm the current Android package identity and prepare a current release APK for later Galaxy installation without opening it after the user asked to pause before device launch.
- Capture the resulting state in a new root-level PDF worklog following the established project convention.

Work Completed - Apple Developer, EAS, and TestFlight Setup

- Completed Apple Developer account verification and EAS credential generation for the Alla Vostra iOS app under team MARTIN ADAM PRAHL, bundle identifier `com.allavostra.app`, and App ID 6815443745.
- Registered and synchronized the iOS bundle identifier and Apple Pay capability, creating/linking the merchant identifier `merchant.com.allavostra` for the app entitlement path.
- Generated a new Apple Distribution Certificate and a new Apple provisioning profile through the EAS credential flow.
- Submitted the first iOS build to App Store Connect, where Apple rejected version 1.0.4 build 1 for ITMS-90683 because `NSCameraUsageDescription` was missing from `Info.plist`.

- Updated mob/app.json by bumping the iOS build number to 2 and adding NSCameraUsageDescription with a user-facing explanation for secure card scanning during checkout.
- Updated mob/eas.json so the TestFlight submit profile includes the App Store Connect app ID 6815443745, reducing ambiguity during future EAS submit runs.
- Ran Expo prebuild and Expo Doctor checks around the iOS configuration change, confirming the generated native Info.plist carried the purpose string and the project health checks passed.
- Built and submitted the corrected iOS version 1.0.4 build 2, then confirmed Apple processing completed and the build became available for internal TestFlight testing.
- Explained TestFlight's 90-day beta-build expiration and the difference between EAS source archive size, IPA size, and end-user download size so the user understood the packaging impact.

Work Completed - iPhone and Simulator Testing

- Detected the physical USB iPhone 14 as Martin's iPhone, paired and reachable for debugging, with identifier A695C49B-60E5-562A-8DC5-6A0F087482A0 and UDID 00008110-000A31300EA1401E.
- Booted a large iOS phone simulator for layout/runtime coverage while keeping the physical iPhone available for real Wallet and Apple Pay testing.
- Installed and opened the TestFlight build on the physical iPhone, then relaunched the app with devicectl when requested so checkout testing started from a clean foreground state.
- Verified that the signed TestFlight binary carried the Apple Pay entitlement, merchant.com.allavostra, team 9966HFKD9U, and the new camera usage purpose string.
- Confirmed the app could open the native Apple Pay sheet after the user added an active Chase debit card to Wallet, with the sheet showing Pay Alla Vostra \$69.55 and side-button confirmation.
- Kept payment interpretation precise: the Wallet sheet could show the real card, but all successful iOS testing stayed in Stripe sandbox/test mode and did not charge the real card.

Work Completed - Apple Pay and Stripe iOS Certificate Configuration

- Investigated the sequence from Apple Pay unavailable to native sheet display to the later app-level message Apple Pay is not available in Alla Vostra, distinguishing device Wallet readiness from Stripe/merchant certificate readiness.
- Verified the deployed app environment used Stripe test publishable and secret keys, the Alla Vostra payment-sheet endpoint, and merchant.com.allavostra for native Apple Pay configuration.
- Guided the Stripe Dashboard sandbox path to Payment methods, Apple Pay, Configure iOS certificates, and Add new application.
- Downloaded Stripe's certificate signing request, opened Apple Developer Certificates, Identifiers & Profiles, and created the Apple Pay Payment Processing Certificate for merchant.com.allavostra rather than the unrelated lower merchant-identity certificate path.
- Uploaded the generated .cer certificate back to Stripe, where the sandbox Apple Pay iOS certificate appeared for merchant.com.allavostra with an October 2028 expiration.
- Relaunched Alla Vostra on the physical iPhone and confirmed the Apple Pay checkout flow completed successfully from the TestFlight app.
- Retrieved the resulting Stripe sandbox PaymentIntent pi_3UJ0zHRoAJjf3pEP1cynAVCd and confirmed it succeeded for \$69.55 in test mode, with no real charge created.

Work Completed - Webhook, Vercel, and Postmark Repair

- Investigated why successful Apple Pay orders were not producing confirmation email metadata or visible emails, isolating the problem to Stripe webhook delivery/backend handling rather

than the phone-side payment flow.

- Imported and inspected the Stripe sandbox webhook endpoint for `https://alla-vostra-api.vercel.app/api/stripe-webhook`, confirming it listened for `payment_intent.succeeded`.
- Updated Vercel production environment configuration so `STRIPE_WEBHOOK_SECRET` and `STRIPE_SECRET_KEY` matched the same Stripe sandbox account used by the TestFlight and local diagnostic flows.
- Created a fresh Stripe sandbox webhook endpoint, copied its signing secret directly into Vercel without printing it, disabled the old mismatched endpoint, and redeployed the backend so the new secret and key loaded in production.
- Added diagnostic logging to `server/api/stripe-webhook.js` for missing/invalid Stripe keys, missing signatures, signature-verification failures, and post-verification webhook handling errors.
- Fixed the deployed Stripe signature-verification problem by reading the raw request stream before touching Vercel's parsed `request.body` helper, preserving the exact payload bytes Stripe signs.
- Exported the webhook config and raw-body helper for test coverage, keeping the handler behavior clear and testable without weakening Stripe signature verification.
- Expanded `server/test/stripe-webhook.test.js` with a regression test proving `readRawBody` reads the request stream before Vercel body helpers are touched.
- Expanded `server/test/postmark.test.js` so merchant and customer email paths must include Total paid and the expected dollar amount in both text and HTML bodies.
- Deployed the corrected backend to Vercel production and verified the final diagnostic `PaymentIntent pi_3UJ1zWRoAJf3pEP0TEkBN` recorded `order_notification_email_sent=yes` and `confirmation_email_sent=yes` with Postmark message IDs present.

Work Completed - Real App Email Verification

- Relaunched Alla Vostra on the iPhone after the backend repair and had the user place a real app Apple Pay sandbox test order from TestFlight.
- Confirmed the user received the merchant-facing email with subject `Paid Alla Vostra order - Apr 3rd at 7:15 PM`, proving the business/order notification path worked from the actual app order.
- Confirmed the user received the customer-facing email with subject `Your Alla Vostra order confirmation`, proving the buyer receipt/confirmation path also worked from the actual app order.
- Explained that the card was not really charged because the app/backend path was still using Stripe test keys even though the Apple Pay sheet displayed the user's real Wallet card.
- Concluded that iOS Apple Pay, Stripe webhook delivery, merchant notification, and customer confirmation were all verified end to end for the TestFlight sandbox path.

Work Completed - Android Current Package Verification

- Detected the connected USB Galaxy device as `SM-G990U` with ADB device ID `R5CRC33MGNZ`, alongside an Android emulator.
- Launched the already installed older/debug-style package `com.anonymous.allavostramobile` only after the user confirmed moving another app to the background was acceptable.
- Checked the current Android project configuration and confirmed the current package is `com.allavostra.app`, while that package was not yet installed on the Galaxy.
- Started building the current Android release APK from `mob/android` so the current package could be installed later without relying on the older anonymous package.
- Resolved local build prerequisites without changing project source by using Android Studio's embedded Java runtime instead of the system JDK 26 and by setting `ANDROID_HOME` and

ANDROID_SDK_ROOT to the local Android SDK path.

- Recovered from a local No space left on device build failure by clearing disposable npm, npx, Playwright, and VS Code ship-it caches, freeing enough disk space for the Gradle release build.
- Built the current Android release APK successfully with Gradle after a long native/Metro release build, producing mob/android/app/build/outputs/apk/release/app-release.apk.
- Verified the APK metadata with aapt: package com.allavostra.app, versionName 1.0.2, versionCode 3, compileSdk 36, targetSdk 36, and application label Alla Vostra.
- Stopped before installing or launching the APK on the Galaxy after the user explicitly requested that the app not be opened on the phone yet.

Validation and Checks Performed

- Verified the U.S. Eastern date locally with TZ=America/New_York date, which reported Wednesday, September 23, 2026 at 10:53:13 PM EDT.
- Extracted and reviewed all 67 prior root-level Alla Vostra PDF worklogs with pdftotext, totaling 20,061 extracted lines and 152,910 words before this worklog was created.
- Confirmed the repository was clean before this PDF generation pass and that the latest source commit was b0f167e198a136efe2a1896482fcf5e5073e6b4d.
- Ran the backend test suite after the webhook and Postmark assertions were added; 12 Node test subtests passed along with syntax checks for backend API and library files.
- Verified Vercel production logs after the final webhook repair showed an info-level POST /api/stripe-webhook rather than a signature-verification or handling error.
- Verified Stripe sandbox PaymentIntent pi_3UJ1zWRoAJf3pEP0TExEkBN succeeded in test mode and carried both merchant and customer email-sent metadata flags.
- Verified both real app emails arrived in the user's inbox after the TestFlight Apple Pay sandbox order: merchant paid-order email and customer order-confirmation email.
- Verified the current Android release APK exists at 117 MB and reports package com.allavostra.app rather than the older com.anonymous.allavostramobile debug package.
- Verified the Galaxy remained untouched after the APK build completed; no install or app launch was performed after the user asked to wait.

Files and Artifacts Touched

- mob/app.json - bumped iOS buildNumber to 2 and added NSCameraUsageDescription for Apple's camera-purpose-string requirement.
- mob/eas.json - added the TestFlight submit App Store Connect app ID for Alla Vostra.
- server/api/stripe-webhook.js - added rejection/handling diagnostics, exported config/helper surfaces for tests, and changed raw body handling to prefer rawBody, request.text, or the request stream before parsed body fallback.
- server/test/stripe-webhook.test.js - added readRawBody coverage to prevent Vercel parsed-body access before raw stream reading.
- server/test/postmark.test.js - added merchant/customer email total assertions for both text and HTML bodies.
- alla_vostra_APP_PROJECT_SNAPSHOT.txt and alla_vostra_WEB_PROJECT_SNAPSHOT.txt - refreshed by the requested project-reading workflow and committed in the September 23 source commit.
- mob/android/app/build/outputs/apk/release/app-release.apk - generated locally as the current Android release APK for later installation/testing, not committed as source.
- Vercel production environment - updated out of band for STRIPE_WEBHOOK_SECRET and STRIPE_SECRET_KEY, then redeployed so the live backend matched the Stripe sandbox webhook and account used by TestFlight testing.
- Stripe sandbox webhooks - created a fresh payment_intent.succeeded endpoint for

<https://alla-vostra-api.vercel.app/api/stripe-webhook> and disabled the old mismatched endpoint.

External Account and Device Context

- Apple Developer team: MARTIN ADAM PRAHL, team ID 9966HFKD9U; App Apple ID 6815443745; iOS bundle identifier com.allavostra.app; merchant identifier merchant.com.allavostra.
- TestFlight build verified: Alla Vostra iOS 1.0.4 build 2, installed and opened on the physical iPhone.
- Physical iPhone: Martin's iPhone, iPhone 14, devicectl identifier A695C49B-60E5-562A-8DC5-6A0F087482A0, UDID 00008110-000A31300EA1401E.
- iOS simulator coverage: large iOS phone simulator booted for layout/runtime support during the iOS setup window.
- Physical Android device: Galaxy SM-G990U detected by ADB as R5CRC33MGNZ; current APK built but not installed after the user requested a pause before device launch.
- Stripe context: sandbox/test mode was used for iOS Apple Pay and webhook diagnostics; no real card charge was created even when the Apple Pay sheet displayed the user's real Wallet card.
- Postmark context: both merchant order notification and customer confirmation paths were verified by actual received emails after the webhook repair.
- Vercel context: production backend alias <https://alla-vostra-api.vercel.app> was redeployed multiple times while diagnosing webhook secret, Stripe account, and raw-body signature behavior.

Follow-up Context

- Install and launch the newly built current Android APK on the Galaxy only when the user is ready, because the user explicitly asked not to open it after the build completed.
- Run one Android checkout regression against the current com.allavostra.app package to confirm the shared backend webhook/email fix works for Android orders too.
- Keep an eye on local disk space before the next native build; the Mac had roughly 1.0 GB free after the Android release APK build, which is low for Gradle, Xcode, and EAS preparation work.
- Continue App Store preparation now that TestFlight Apple Pay works: app privacy answers, screenshots, metadata, review notes, TestFlight external-testing path, and eventual App Review submission.
- Before live production payment launch, rotate from Stripe sandbox keys to live keys deliberately, create the matching live webhook secret, repeat an intentionally small live payment validation, and document the difference between sandbox and live charges.
- Commit this September 23 PDF artifact separately if preserving the project convention of source/config commits followed by documentation-only worklog commits.

Output Artifact

- Generated PDF: [alla_vostra_worklog_september23.pdf](#).
- Location: repository root, alongside the existing Alla Vostra worklog PDFs from May through September.
- Title: Alla Vostra Mobile App Work Log - September 23, 2026.
- Subject: Alla Vostra September 23 2026 iOS TestFlight, Apple Pay, Stripe webhook, Postmark, and Android APK readiness worklog.
- This artifact records the verified Eastern-time September 23 work window, the committed source state at b0f167e, and the local Android APK build state reached immediately afterward.
