

Alla Vostra Mobile App Work Log - June 19, 2026

Compiled summary for Friday, June 19, 2026 - focus: global sticky cart access, cart overlay ordering and receipt logic, product-overlay add/remove simplification, empty-cart messaging, fixed cart columns, and item-removal affordances.

Generated automatically on June 19, 2026 after reviewing the June 17 and June 18 worklog PDFs, the June 19 Git commit chain, the current mobile Shop/cart source files, parser checks, and the clean working tree state.

Includes tracked Git work from commits 4bb9a0f, c6bcdcc, c5921fe, b5072f6, f491f0b, and ed1495b, which together advanced the Shop screen from a local cart prototype into a more persistent, app-wide shopping-cart experience.

Source Materials Processed

- Read the June 17 and June 18 root-level PDF worklogs with pdftotext to preserve the established title cadence, source-material section, compact bullet style, validation section, follow-up context, and output-artifact close.
- Reviewed the June 19 Git history from commit 4bb9a0f through ed1495b, including timestamps, commit messages, file lists, and patch stats for the sticky cart, cart-overlay, product-overlay, empty-cart, fixed-column, and remove-button changes.
- Checked current Shop source hotspots for sticky cart access, cartOverlay, overlayCartBillableProducts, taxes, delivery fee, Checkout, empty-cart messaging, fixed product columns, and red remove-button behavior.
- Confirmed the working tree was clean before creating this artifact, so the app state described here reflects the committed June 19 baseline before this PDF was added.
- Used pdftotext, git log, git show --stat, git status, rg, sed, node --check, and git diff --check locally; no external PDF package was installed for this artifact.

Current Baseline to Preserve

- Primary app work remains in /Users/prahlin/alla_vostra/mob, with Expo Router and React Native as the mobile runtime surface.
- Shop cart state now lives in a shared context, allowing the cart button and cart overlay to work from more than just the Shop preview screen.
- The cart overlay still uses the established Shop overlay shell: cream content area, orange top and bottom bands, hairlines, rounded black-bordered frame, and a fixed white receipt-style bottom area.
- The product-entry overlay now treats ADD as the primary confirmation action. Quantity edits after confirmation intentionally unconfirm the item and make the ADD button visible again.
- Checkout remains a visual placeholder button. June 19 improved cart data and totals, but did not connect a backend payment processor or order API.

Main Goals We Worked Toward

- Make shopping-cart access global and sticky so a user can reach the cart from anywhere in the mobile app without first navigating through the Shop preview sequence.
- Clarify the difference between changing a quantity and committing a product into the cart, reducing confusing plus/checkmark behavior on product entries.
- Make the cart overlay feel stable: selected product columns should appear or disappear without causing other products to slide horizontally into new positions.
- Improve the receipt-like bottom white area with delivery fee, tax calculation, grand total placement, and a responsive green total amount.
- Give empty and removal states a cleaner experience: a centered empty-cart message when nothing is selected, and a small red minus button for removing a whole cart entry.

Work Completed - Global Sticky Cart Access

- Added a shared ShopCartProvider so cart quantities, confirmations, selected products, and cart-open requests can persist beyond the Shop screen itself.
- Mounted the cart provider at the app layout level so the shopping cart state is available globally across mobile routes.
- Created a reusable StickyCartButton component and stickyCartStyles so the shopping-cart button appears in its bottom-right position across the app.
- Extracted ShoppingCartIcon into a component so the same cart icon can be reused cleanly rather than redrawn inside individual screens.
- Made tapping the sticky cart button open the cart overlay directly, avoiding the brief Shop preview flash and reducing delayed dimming or visibility trails in the app header area.
- Preserved the existing Shop overlay behavior for product browsing while allowing direct cart access when the user already knows they want the cart.

Work Completed - Shared Cart State and Product Data

- Moved product/cart helper data into mob/data/shopOverlayProducts.js, including product definitions, initial state creation, price parsing, and currency formatting helpers.
- Added overlayProductQuantities and overlayProductConfirmations to shared cart context so every product can track quantity and confirmed status consistently.
- Added overlayCartProducts and overlayCartBillableProducts so the cart overlay can distinguish visible product columns from billable receipt rows.
- Added requestCartOverlayOpen and cartOverlayActionRequest so global cart UI can request the Shop cart overlay without duplicating navigation logic.
- Kept currency formatting resilient with en-US thousands separators and decimal handling for tax-inclusive totals.

Work Completed - Cart Overlay Receipt Area

- Expanded the cart overlay white bottom area significantly so it could hold item rows, delivery fee, taxes, total, and Checkout without cramped stacking.
- Added Delivery fee and Taxes rows to the white summary area, with taxes calculated as 6% of item subtotal plus delivery fee.
- Kept Delivery fee and Taxes hidden when the cart has no billable products, preventing empty carts from showing artificial charges.
- Repositioned Checkout to the top-right portion of the white area and placed TOTAL with the green amount beneath it.
- Made the green total amount box responsive enough for larger totals, while preserving the hairline border and single-line formatting.
- Aligned the left-side receipt rows so product names, quantities, equals signs, and totals read as a compact receipt block.

Work Completed - Receipt Row Alignment

- Moved product-name rows to the top of the white receipt area and fee/tax rows to the bottom, so the section has a more deliberate top-and-bottom structure.
- Made Taxes sit as low as possible above the bottom margin, with Delivery fee directly above it and product rows anchored at the top margin.
- Applied internal white-area margin logic to the assets inside the white box rather than moving the white box itself.
- Gave the white receipt area dynamic height calculations so content can grow upward when needed instead of clipping or crowding the fixed orange band.
- Kept summary rows ordered according to billable product order, so toggling a product back

above 0 can append its product name back into the product-name row list.

Work Completed - Product Overlay Add / Remove Simplification

- Changed the product-overlay ADD button fill from orange to green while preserving the white font and existing opacity/visibility behavior.
- Removed the pending plus button from the product overlay while preserving the confirmed checkmark box position, timing, appearance, and behavior.
- Changed showOverlayAddedState so the ADD button only looks dimmed/added when the product is actually confirmed, not merely when the quantity is above 0.
- Made quantity changes after a confirmed checkmark clear confirmation, causing the ADD button to reappear at full visibility and requiring the user to tap ADD again to recommit that product.
- Narrowed the product-overlay white counter box to match the checkmark box width and made the triangle controls follow that narrower stack.
- Increased the product-overlay triangle height while preserving width and placement, then restored the horizontal position after sizing was corrected.

Work Completed - Cart Product Columns

- Converted the cart overlay product-display area into a stable three-column grid based on the full product set rather than the number of currently selected products.
- Changed the render path so all product columns are always reserved, while each product entry is shown or hidden inside its own fixed column.
- Prevented horizontal repositioning when products are added or removed: Piccola, Sei Perfetto, and Buon Natale each retain their respective one-third screen slots.
- Kept product columns top-to-bottom: product header, image, price tag, up triangle, counter, down triangle, and the later remove control.
- Maintained vertical dividers only when product columns are active; empty cart mode now skips the column grid entirely so no dividers appear behind the empty message.

Work Completed - Empty Cart Message

- Added an empty-cart state inside the cream cart overlay area, conditional on entering the cart before selecting any products.
- Displayed the message as four deliberate lines: Your, Alla Vostra, shopping cart, and is empty.
- Styled only Alla Vostra in Dream Avenue while switching the surrounding lines to TT Fors for a cleaner contrast.
- Increased the surrounding empty-message text to 28px and the Alla Vostra brand line to 40px.
- Added balanced vertical spacing around the Alla Vostra brand line so the gap above and below that row feels matched.
- Removed product-grid dividers when the cart is empty, leaving the message alone in the cream area.

Work Completed - Cart Remove Button

- Added a red remove control underneath the counter assets for each visible cart product entry.
- Started with an ADD-button-like red remove button, then shortened it, rounded it into a circular button, and changed the text to a minus sign.
- Scaled the round minus button so its diameter matches the cart quantity triangle width, keeping the control visually tied to the counter stack.
- Doubled the minus glyph size for better legibility while leaving the circular button dimensions intact.

- Made tapping the red minus button clear that product quantity to 0 and remove its confirmation, immediately removing that product entry from the cart overlay.
- Kept the separate counter decrement behavior intact: tapping the down triangle can still reduce an item to 0 as a reversible low-visibility editing state before the user leaves or removes it.

Validation and Checks Performed

- Ran node --check mob/app/shop.js after the Shop/cart overlay render, context, and interaction changes.
- Ran node --check mob/styles/shopStyles.js after style changes for the white receipt area, empty-cart message, green ADD button, product counters, fixed columns, and red minus button.
- Ran node --check mob/utils/shopCartContext.js after shared cart-state and billable-product ordering changes.
- Ran git diff --check during the iteration sequence to catch whitespace or patch-format problems.
- Reviewed June 19 commit stats and current source hotspots to ensure this worklog reflects the committed implementation rather than stale intermediate experiments.
- Confirmed the working tree was clean before creating this June 19 PDF artifact.

Files Touched / Added During June 19

- Global layout/provider wiring: mob/app/_layout.js.
- Primary Shop implementation: mob/app/shop.js.
- Reusable cart icon: mob/components/ShoppingCartIcon.js.
- Global sticky cart button: mob/components/StickyCartButton.js.
- Product/cart data helpers: mob/data/shopOverlayProducts.js.
- Shop styling: mob/styles/shopStyles.js.
- Sticky cart styling: mob/styles/stickyCartStyles.js.
- Shared cart context: mob/utils/shopCartContext.js.
- This final worklog generation creates alla_vostra_worklog_june19.pdf at the repository root.

Important Follow-Up Context

- Checkout is still intentionally visual-only. The next major implementation step can connect the cart totals and selected products to a checkout route, backend order endpoint, or hosted payment provider.
- The sticky cart button now gives users a faster path into cart state; future route work should preserve this bypass behavior and avoid flashing intermediate Shop screens.
- There are now two removal concepts: down-triangle quantity editing and red minus full-entry removal. Keep those behaviors distinct unless the desired cart UX changes.
- The fixed-column cart layout intentionally preserves product identity and position. Future layout changes should avoid reflowing products horizontally based on cart count.
- The cart overlay still relies on careful absolute-positioned sizing around the orange bands and white receipt area, so future height changes should be checked against small screens.
- The product-entry quantity and cart-entry quantity controls share visual language but remain separate implementation blocks. Extract a shared component only after the visual behavior fully settles.

Output Artifact

- Created this worklog PDF: alla_vostra_worklog_june19.pdf.
- No external PDF package was installed; this artifact was generated with a small standard-

library PDF writer in the same plain-text-readable spirit as the prior daily worklogs.
