

Alla Vostra Mobile App Work Log - July 18, 2026

Compiled summary for Saturday, July 18, 2026 - focus: Google Play closed-testing publication, privacy policy hosting, Play Console app-content declarations, Data safety, store listing assets, tester access configuration, Testers Community submission, Stripe test-mode guidance, and repository documentation for the Alla Vostra mobile app project.

This work log continues the established Alla Vostra daily record format: a concise but complete narrative of what changed, what was validated, what external console state was updated, and what future sessions need to preserve.

Source Material Reviewed

- Reviewed the existing root-level PDF worklogs from May, June, and July to match the current naming convention, section rhythm, length, and summary style.
- Inspected recent July worklogs, especially July 8, July 9, and July 11, to preserve the current convention of baseline, goals, work completed, validation, files touched, follow-up context, and output artifact sections.
- Checked the repository history and working tree to understand the most recent committed changes before creating this artifact.
- Used the Play Console screenshots, user decisions, tester setup notes, and closed-testing publication status from the July 18 session as the primary source for this worklog.
- Confirmed the current uploaded Android App Bundle scope and payment-mode behavior discussed during the release flow.

Baseline Status Before Today's Work

- Alla Vostra already had a mobile-focused React Native / Expo app under the mob directory and a separate hosted web presence outside the mobile bundle.
- The Android app had previously been prepared for Play testing with package identity `com.allavostra.app`, a production AAB build path, and Play Store assets generated in the repository.
- The project already had a set of daily PDF worklogs at the repository root, plus app and web project snapshot files used as continuity documents.
- The checkout flow was known to use Stripe infrastructure but remained configured for test-mode payments for closed testing, not live card charges.
- The user needed the Play Console setup moved from draft app preparation into an active closed-testing release that selected testers could access.

Goals for July 18

- Complete the remaining Google Play Console app-content checklist items required before closed testing could be sent for review.
- Host and submit a public privacy policy URL suitable for the Play Store listing.
- Fill the store listing with accurate Android-facing language, graphics, screenshots, category, and contact details.
- Submit the closed-testing AAB to the Alpha closed-testing track without making the app public in production.

- Configure tester access correctly, including the Testers Community Google Group and feedback channel.
- Document the final testing workflow in the repository so future work can resume without relying on memory or chat history.

Work Completed - Privacy Policy and App Content

- Drafted a Play-ready privacy policy for Alla Vostra, including plain-language coverage of order/contact/payment data, third-party processors, deletion requests, children's privacy, and support contact routing.
- Provided the privacy policy as a complete HTML file so it could be uploaded to the existing Hostinger-hosted allavostra.com site.
- Confirmed the privacy policy URL path in Play Console as <https://allavostra.com/privacy> after the file was placed under the hosted public web root.
- Completed Sign-in details by declaring that the app does not require sign-in, user accounts, or restricted account-gated areas.
- Completed the Ads declaration by confirming the app does not contain ads and does not use an advertising ID.
- Completed the content rating questionnaire under All Other App Types, with no violence, sexual content, profanity, controlled substances, gambling, social networking, location sharing, news/current events, alcohol/tobacco sales focus, digital-goods sale, web-browser/search-engine function, or educational-primary classification.
- The generated ratings were low-age/general ratings, including North America Everyone and Europe PEGI 3.
- Set target audience to 18 and over only, without using Google's optional minor-blocking setting.
- Completed Government apps as no and Health as no.
- Completed Financial features as no, because the app takes payment for physical catering/grazing-board orders rather than providing regulated financial products or services.

Work Completed - Data Safety

- Completed the Data safety form by declaring that the app collects and shares required user data types related to order placement, delivery, contact, payment processing, and support messages.
- Confirmed that user data is encrypted in transit through HTTPS/TLS-backed app and payment flows.
- Declared that the app does not allow users to create accounts and does not allow login with externally created accounts.
- Declared that users can request deletion by contacting Alla Vostra, matching the privacy policy support path.
- Selected Personal info data types: name, email address, address, and phone number.
- Selected Financial info data types: purchase history and user payment info.
- Selected Messages data type: other in-app messages, because the contact/support form can

transmit a message to the business.

- Did not select location because the app uses delivery address information, not device GPS or current precise/approximate location.
- For personal info, declared collected and shared, not processed ephemerally, required, and used for app functionality, developer communications, and fraud prevention/security/compliance.
- For financial info, declared collected and shared, not processed ephemerally, optional, and used for app functionality and fraud prevention/security/compliance.
- For messages, declared collected and shared, not processed ephemerally, optional, and used for app functionality, developer communications, and fraud prevention/security/compliance.

Work Completed - Store Listing

- Completed the default English (United States) store listing for Alla Vostra.
- Set the app name to Alla Vostra.
- Used the short description: Handcrafted grazing boards delivered across South Florida.
- Prepared a full description focused on handcrafted grazing boards, South Florida delivery, secure checkout, and effortless entertaining.
- Kept Android listing language platform-appropriate by avoiding Apple Pay references in the Play Store copy.
- Set the app category as Food & Drink and used relevant store-listing context for shopping/food-delivery style discovery.
- Uploaded the app icon from mob/assets/store/app-icon.png, matching Google's 512 x 512 app-icon requirement.
- Uploaded the feature graphic from mob/assets/store/feature-graphic.png, matching Google's 1024 x 500 feature-graphic requirement.
- Uploaded the phone screenshots prepared for the mobile app listing and intentionally left tablet-specific screenshot slots unused because the project is not being positioned as a tablet app.
- Updated store contact/settings information, including the public website <https://allavostra.com> and the appropriate contact email choices used during Play Console setup.

Work Completed - Closed Testing Release

- Created and submitted the Alpha closed-testing release in Google Play Console.
- Used the Android App Bundle at dist/alla-vostra-play-test-v1.aab.
- Release version was 1.0.0 with version code 1.
- Release notes were set to: Initial closed testing release.
- Confirmed the release was for Closed testing - Alpha and not a production/public Play Store rollout.
- Resolved the advertising ID declaration blocker by confirming the app does not request com.google.android.gms.permission.AD_ID and does not use ads/AdMob style SDK behavior.

- Acknowledged the missing deobfuscation-file warning as a debugging/ANR analysis warning, not a blocker and not a security vulnerability by itself.
- Submitted the release and app changes for review through Publishing overview.
- Confirmed later in Submission activity that the closed-testing changes were published, with the Alpha release available to selected testers.

Work Completed - Tester Access

- Reviewed the difference between Play Console email-list tester selection and Google Groups tester selection.
- Confirmed that the Testers Community flow expected a Google Group address rather than relying on a plain email-list entry.
- Updated the Closed testing - Alpha tester access to use the Google Group testers-community@googlegroups.com.
- Set the tester feedback email to martin@prahlproductions.com.
- Submitted the tester-access changes through Publishing overview and confirmed Play Console recorded them as a second published submission.
- Captured the tester opt-in URL pattern for the closed test as <https://play.google.com/apps/testing/com.allavostra.app>.
- Explained that the opt-in URL is a web link used to join the test, but testers still install and test the Android app through Google Play on an Android device.

Work Completed - Testers Community Submission

- Submitted Alla Vostra to Testers Community after the Play closed-testing release was active and available to selected testers.
- Used the Starter / Private Testing Starter plan for 15 testers.
- Uploaded the app icon and supplied the Play closed-testing opt-in URL.
- Provided tester instructions stating that no account or login is required.
- Added checkout instructions that the build is in Stripe test mode and testers should use test card 4242 4242 4242 4242 with any future expiration date, any CVC, and any ZIP/postal code.
- Explained that Testers Community showing Day 0 / 16 is likely their buffer around Google's 14-day continuous closed-testing requirement, not a separate Play Console requirement.
- Clarified that submitting to Play Console before submitting to Testers Community was not a problem; the Testers Community app submission depends on the Play testing link being active.

Work Completed - Payment and App Scope Clarification

- Confirmed that the Play closed-testing build should be treated as Stripe test mode only, using placeholder test card numbers rather than real customer card charges.
- Explained the practical difference between digital goods and physical goods for Play Console declarations: Alla Vostra sells physical food/catering orders, not in-app digital content or digital entitlements.

- Confirmed that Google Pay and PayPal may be relevant to Android checkout presentation, but Apple Pay should not be mentioned in the Android Play listing.
- Verified the uploaded AAB scope: the mobile bundle includes the native app bundle and Stripe Mobile SDK bridge web assets, but not the separate Alla Vostra public website, Hostinger files, public_html files, privacy page, or backend/server source.
- Clarified that only mobile build outputs derived from the Alla Vostra mobile app are packaged in the AAB; repository-level web and server files remain outside the Android app bundle.

Work Completed - Repository Documentation

- Created docs/play-store-testing.md to preserve the public-safe Play Store closed-testing workflow and the decisions made during the console setup.
- Documented that the closed-testing release is not public production, that tester access is via Google Groups, and that testers still install the Android app through Google Play after opening the opt-in link.
- Documented the Stripe test-mode instructions so future sessions do not accidentally describe or test the closed-testing build as live-payment production.
- Documented that future uploaded AABs must use a higher versionCode and should preserve a clean record of which source commit produced each uploaded bundle.
- Updated project snapshots to reflect the Play Console and testing status so future work can continue from a stable project memory rather than chat-only notes.
- Removed the Android header overlap tweak from mob/components/AppHeader.js and refreshed the app/web snapshots alongside the Play testing documentation.

Validation and Checks Performed

- Used repository search and prior build inspection to verify the app does not request the Android advertising ID permission.
- Used AAB inspection to confirm the closed-test bundle does not contain the separate website or public_html pages.
- Confirmed store asset dimensions for the generated app icon and feature graphic before upload.
- Confirmed Play Console accepted the app-content checklist items and eventually showed the setup checklist at 10 of 11 complete, with closed testing active.
- Confirmed Submission activity showed the closed-testing and tester-access changes as published.
- Confirmed the Testers Community dashboard accepted the app submission and began tracking the app as in testing.
- Checked git history/status after the documentation and snapshot updates to identify what had already been committed before generating this PDF worklog.

Files Touched During July 18

- docs/play-store-testing.md - added durable Play Store / closed-testing workflow notes for the project.

- mob/components/AppHeader.js - removed the Android header overlap tweak as part of the later cleanup captured in the current repository history.
- alla_vostra_APP_PROJECT_SNAPSHOT.txt - refreshed mobile project snapshot/context.
- alla_vostra_WEB_PROJECT_SNAPSHOT.txt - refreshed web project snapshot/context.
- alla_vostra_worklog_july18.pdf - generated this daily worklog artifact following the repository's existing PDF naming convention.
- External state also changed in Google Play Console, Hostinger/allavostra.com privacy hosting, and Testers Community, but those are console/service records rather than repository source files.

Follow-Up Context

- The current closed-testing release is active for selected testers, not public production.
- Monitor Play Console and Testers Community for tester opt-ins, progress reports, and any failed tester-access signals.
- Keep the checkout instructions test-mode only until production Stripe configuration is intentionally enabled and verified.
- If code changes are made after this uploaded AAB, generate a new AAB with a higher versionCode before uploading another Play release.
- Do not remove the Google Groups tester configuration unless replacing it with another confirmed tester-access path.
- Before production access, preserve the privacy URL, app-content answers, Data safety declarations, and store contact details as the official Play Console source of truth.
- The hosted privacy page and Testers Community setup are important release artifacts, but the repository documentation remains a project memory aid, not a substitute for Play Console state.

Output Artifact

- Generated PDF: alla_vostra_worklog_july18.pdf
- Location: repository root, /Users/prahlin/gh/alla_vostra
- Generation style: standard-library PDF writer with plain text extraction support, matching the recent Codex-generated worklog artifacts.
