

Alla Vostra Mobile App Work Log - July 27 and July 28, 2026

Compiled summary for Monday, July 27 into Tuesday, July 28, 2026 - covering the nested node_modules snapshot cleanup, project-memory refresh, and the polished Play Store feature graphic pass for Alla Vostra.

This worklog follows the project convention used by the existing root-level PDF logs: concise narrative sections, implementation context, validation notes, files touched, and a short follow-up list for the next design or release pass.

The request began late on July 27 in U.S. Eastern time and completed after midnight on July 28, so the artifact is named for the current Eastern date while the title records both working dates, matching the cross-date precedent already present in the project worklogs.

Source Material Reviewed

- Reviewed the pre-existing root-level Alla Vostra worklog PDFs from May, June, and July to match naming, structure, density, and tone.
- Inspected the most recent logs in detail, especially July 25, along with representative earlier logs such as July 18, July 11, July 9, July 8, July 7, June 27, and May entries.
- Checked the current Git state, branch, latest commit, and committed diff summary. The latest commit was 4b5e868 on main/origin/main: Polished Play Store mockups and snapshot ignores.
- Reviewed the generated project snapshot files, the snapshot-reading shell script, ignore files, and the Play Store feature graphic generator and output paths.
- Confirmed the U.S. Eastern calendar date during generation. The work started before midnight on July 27 and finished after the clock crossed into Tuesday, July 28.

Baseline Status Before This Work

- The app project already had a Play Store mockup workspace under docs/play-store/screenshots/mockups, with a JavaScript generator producing 1920 x 1080 feature graphic PNG files.
- The recent design focus was the feature-graphic-polished Dream Avenue mockup: a hero marketing image with Alla Vostra branding, badge stack, ELED/tagline copy, phone-frame screenshots, and food imagery.
- The project snapshot files were too noisy because nested node_modules paths could still leak into generated snapshots, making project-memory reads far longer than intended.
- Typography assets such as Dream Avenue and TT Fors were already present and were being used to push the Play Store graphic closer to the desired final visual language.
- No production app behavior, backend behavior, payment flow, or Play Console release configuration was changed in this pass; the work was design-output and project-memory focused.

Goals Worked Toward

- Make the repository and snapshot tooling truly ignore node_modules paths, including nested node_modules directories, so future project snapshots stay compact and useful.
- Run the project-reading workflow and study the existing snapshots and worklogs before continuing layout changes, preserving continuity with the design direction already established.
- Polish the Play Store feature graphic mockup by iterating on Alla Vostra wordmark placement, ELED/tagline placement, badge positioning, badge scaling, font usage, and vertical spacing.
- Regenerate the committed mockup PNG outputs from source rather than hand-editing image assets directly, keeping the design reproducible from the generator script.
- Create a new daily PDF worklog in the same style as the existing project logs, summarizing the project work and validation performed since the prior log.

Work Completed - Snapshot Hygiene and Project Memory

- Updated ignore coverage so nested node_modules paths are excluded consistently. The root .gitignore, root .easignore, and mob/.easignore now include explicit recursive node_modules coverage.
- Updated read_project.sh so project snapshot generation prunes node_modules directories wherever they appear, not only at shallow paths.
- Regenerated the app and web project snapshot text files after the ignore/prune changes. The committed snapshot diff dropped a large amount of generated noise and made the files easier to review.
- Preserved the project snapshot workflow itself while narrowing what it captures. The intent is to keep snapshots useful as Codex context without allowing package trees to dominate future reads.
- Read through the refreshed snapshots and recent worklogs before continuing with the feature graphic, maintaining the project-memory habit used throughout the Alla Vostra worklog sequence.

Work Completed - Feature Graphic Generator Refactor

- Expanded docs/play-store/screenshots/mockups/generate-feature-graphic.js so the feature graphic can carry variant-specific typography, positioning, brand-title settings, badge settings, and phone/image layout values.
- Kept the polished standard output and the Dream Avenue output generated from the same source script, reducing one-off asset drift between variants.
- Added TT Fors handling for badge and ELED/tagline text so those elements could move away from the earlier default font treatment.
- Added stronger control over the brand name lines, including split Alla/Vostra rendering, independent letter spacing, bold weight, stroke thickness, and line positioning.
- Reworked conditional text blocks so the older right-side paragraph and the Deliciousness awaits message could be removed cleanly from the Dream Avenue composition.

- Added draw-order control for the screenshot/device stack so the center device remains visually dominant while the side frames retain the intended depth relationship.

Work Completed - Dream Avenue Wordmark and Copy Layout

- Moved the Alla Vostra/ELED/paragraph cluster through several spacing passes to match requested vertical relationships between the top edge, the text stack, and the device frame below.
- Removed the right-side paragraph text entirely and moved the regular-font ELED/tagline copy to that side of the graphic, then increased its size substantially while avoiding screen-edge clipping as far as the generator measurements allowed.
- Changed the text beneath the brand treatment to: Passionately Home-Made. Tastefully Sampled. Unforgettable.
- Split Alla Vostra onto two lines, enlarged the brand treatment, centered Alla horizontally relative to Vostra, reduced Alla kerning after the widened pass, and then scaled Alla so its left-to-right bounds matched Vostra without warping the word.
- Boldened the Alla Vostra wordmark and added a black hairline stroke that was later darkened and doubled twice to reach the heavier outline requested.
- Moved the whole title/ELED stack down in repeated 10 px passes after the initial 30 px move so the top padding and device-frame relationship landed closer to the requested balance.

Work Completed - Badge Stack and Device Composition

- Recentered the badge stack horizontally above the center device frame and vertically between the top edge of the screen and the center device frame.
- Adjusted the ELED/tagline line spacing. A doubled line-spacing pass was reduced to a half-step version after review, keeping the right-side copy airier without over-separating the lines.
- Changed the badge and ELED/tagline fonts to TT Fors, aligning them with the requested custom-font direction.
- Scaled the \$10 delivery badge box and its font to 5 percent larger than the Miami-Dade badge, while scaling the 12-hour shipping badge asset about 10 percent larger than the Miami-Dade badge.
- Regenerated the Play Store feature graphic outputs, including feature-graphic-polished-1920x1080.png and feature-graphic-polished-dream-avenue-1920x1080.png.
- Kept the Dream Avenue output as a generated marketing mockup asset, with all current changes represented in the generator rather than only in the exported PNG.

Validation and Checks Performed

- Ran the project-reading workflow and inspected the resulting snapshots and worklogs before continuing layout work.

- Checked Git status before the worklog artifact was generated; the repository was clean after the committed Play Store mockup and snapshot-ignore changes.
- Reviewed the latest commit and file stats to make sure the worklog covered the relevant committed changes: ignore files, read_project.sh, app/web snapshots, generator code, and regenerated PNG outputs.
- Used DOM/canvas measurement checks during the mockup iteration. Badge center alignment was measured within a tiny rounding delta, and the relative badge scale ratios matched the requested 5 percent and 10 percent hierarchy closely.
- Verified the generated PDF with pdftinfo and pdftotext after creation to confirm letter-size output, readable extracted text, metadata title, and expected page count.
- Did not run an Expo/mobile app build, Android device test, backend integration test, or Play Console upload as part of this design/mockup-focused pass.

Files Touched During This Work

- .gitignore - added recursive node_modules ignore coverage for snapshot hygiene.
- .easignore and mob/.easignore - added recursive node_modules ignore coverage for build/archive hygiene.
- read_project.sh - updated project snapshot generation so node_modules directories are pruned wherever they appear.
- alla_vostra_APP_PROJECT_SNAPSHOT.txt and alla_vostra_WEB_PROJECT_SNAPSHOT.txt - regenerated after the ignore/snapshot pruning changes.
- docs/play-store/screenshots/mockups/generate-feature-graphic.js - expanded the feature graphic generator with variant-driven layout, font, badge, and wordmark controls.
- docs/play-store/screenshots/mockups/output/feature-graphic-polished-1920x1080.png and feature-graphic-polished-dream-avenue-1920x1080.png - regenerated from the updated generator.
- alla_vostra_worklog_july28.pdf - created as the current PDF worklog artifact for this cross-midnight work session.

Follow-Up Context

- Future snapshot generation should remain much smaller as long as recursive node_modules pruning stays in place.
- The feature graphic should continue to be edited through generate-feature-graphic.js, then regenerated, so the PNG output stays reproducible.
- The Dream Avenue composition is now tuned around the large two-line Alla Vostra treatment, the right-side TT Fors ELED/tagline copy, centered/scaled badges, and the center phone frame as the primary visual anchor.
- If font metrics or export dimensions change, recheck the right-side tagline bounds, especially the longer Tastefully Sampled line, because that copy now sits large and close to the right side of the feature graphic.

- The current work was focused on Play Store marketing artwork and project-memory hygiene. Production feature claims, payment behavior, subscription/access rules, and Play Console release copy should still be verified separately before publication.

Output Artifact

- Generated PDF: `alla_vostra_worklog_july28.pdf`.
- Location: repository root, alongside the existing Alla Vostra worklog PDFs.
- Format: letter-size PDF, generated with the same lightweight standard-library style used by recent project worklogs.
