

Alla Vostra Mobile App Work Log - September 15, 2026

Compiled summary for Tuesday, September 15, 2026 - focus: verified U.S. Eastern-time date handling, full pre-existing worklog review, project-context refresh, PayPal checkout correction, iOS numeric-keyboard controls, Android 1.0.4 Play release readiness, delivery-schedule persistence, merchant order notification, tax-rate correction, endpoint hardening, backend behavioral test coverage, production environment and webhook checks, Google Pay Console onboarding, native Android Google Pay button replacement, Google Pay buyflow screenshot capture, preview APK/device testing, and release-prep artifact generation for Alla Vostra.

Generated in continuity with the established Alla Vostra worklog cadence: compact opening summary, source-material review, baseline, goals, grouped work-completed sections, validation, files touched, external account/device context, follow-up context, and output-artifact close.

This artifact is named `alla_vostra_worklog_september15.pdf` because the verified repository U.S. Eastern-time date used for generation was Tuesday, September 15, 2026, and no earlier September 15 root-level Alla Vostra worklog PDF existed before this documentation pass. The Eastern date was checked with `TZ=America/New_York` date, which reported Tuesday, September 15, 2026 at 22:48 EDT during the generation window.

This PDF records the work window after `alla_vostra_worklog_september12_part1.pdf` and documentation commit `fc3cbf3`, through synced source commits `f1d1534` Fixed PayPal checkout and added iOS keyboard controls, `d0f839b` Prepare Android 1.0.4 checkout for Play release, and `eb17526` Added native Google Pay checkout and release prep artifacts, plus the local Vercel, Stripe, Postmark, Google Pay Console, physical Android, APK, and validation operations completed around that source work.

Source Material Reviewed

- Reviewed all 65 pre-existing root-level Alla Vostra PDF worklogs from May, June, July, August, September 7 Part 1, September 8, September 9, September 11, and September 12 Part 1 to preserve the project naming pattern, letter-size PDF output, title cadence, metadata, section order, validation language, files-touched inventory, external account/device notes, follow-up cadence, and output-artifact close.

- Extracted the complete root-level worklog set with `pdftotext` into a temporary text set and confirmed the study pass covered 65 text artifacts, 18,321 extracted lines, and 145,568 words of prior project history before drafting this September 15 artifact.

- Used `alla_vostra_worklog_september12_part1.pdf` as the closest style anchor because it is the immediately preceding project PDF and defines the current mobile-device testing, Expo/Metro, native payment, source-commit capture, and documentation shape.

- Rechecked `alla_vostra_worklog_september11.pdf`, `alla_vostra_worklog_september9.pdf`, and `alla_vostra_worklog_august24.pdf` because the September 15 work depended on the iPhone development-client lane, Android Expo Go/native Stripe split, Google/Apple/PayPal payment readiness, Play Console production path, and Vercel/Postmark/Stripe/PayPal deployment posture established there.

- Reviewed the app and web project snapshots at the repository root, including their project instructions, current mobile source layout, root worklog inventory, Expo/React Native dependency posture, server directory, screenshots, generated native context, and checkout stack.

- Reviewed git history after the September 12 Part 1 PDF worklog commit, including `f1d1534`, `d0f839b`, and `eb17526`, plus each commit body, diff stat, name-status surface, and source-file list.

- Inspected mobile payment files touched by the window: `mob/app/shop.js`, `mob/app/contact.js`, `mob/components/IOSKeyboardAccessory.js`, `mob/styles/shopStyles.js`, `mob/utils/stripeNative.js`, `mob/app.json`, and `mob/eas.json`.

- Inspected backend files touched by the release-readiness window: `server/api/contact-message.js`, `server/api/payment-sheet.js`, `server/api/paypal-create-order.js`, `server/api/paypal-capture-order.js`, `server/api/stripe-webhook.js`, `server/lib/http-security.js`, `server/lib/orders.js`, `server/lib/paypal.js`, `server/lib/postmark.js`, `server/README.md`, and the new server tests.

- Reviewed release and integration artifacts, including `.vercelign`

ore, removal of the root .easignore, the Google Pay Console screenshot folder, the native Google Pay payment-sheet capture, and the Android app version metadata now set to 1.0.4 / versionCode: 5.

Alla Vostra Mobile App Work Log - September 15, 2026 | Page 1

Baseline Status Before September 15

- The September 12 Part 1 worklog left the app with recently tuned checkout overlays, delivery pickers, Stripe card-entry paths, Android and iOS device QA lanes, restored tutorial animation behavior, and improved iOS header/shop text alignment.

- PayPal was present in the checkout flow, but user testing showed that a PayPal order could still reach card-detail validation and that a green acceptance mark could appear before the customer actually authenticated and approved the PayPal payment.

- iOS numeric entry remained awkward in several fields because numeric keypads do not always provide a visible Done or OK dismissal button; the user observed this on iPhone 14 and wanted the iOS version improved rather than relying on the system keyboard alone.

- The release-readiness review identified four major Play-blocking concerns: delivery scheduling was being sent by the app but discarded by the backend, the business had no reliable paid-order notification, tax handling needed correction or professional confirmation, and the Play version still matched the already released version code.

- Vercel production already held several required environment variables, but their hidden values needed practical confirmation through production smoke checks, Stripe webhook inspection, and UI-side setup where secret values could not be read back from the dashboard.

- The backend had syntax checks but did not yet have meaningful behavioral tests for order construction, schedule preservation, email delivery behavior, PayPal metadata retention, Stripe webhook success handling, CORS, or rate limiting.

- Google Pay production testing could not be completed until Google Pay & Wallet Console business profile and Android app integration details were completed for com.allavostra.app.

- The physical Android test lane centered on the Galaxy S21 FE for preview APK testing and Google Pay verification, while the iPhone device remained relevant for iOS keyboard and Apple Pay discussion but not for Android Google Pay Console approval.

Goals for September 15

- Fix PayPal so it behaves as a true PayPal approval path, not a premature success state or a fallback into card-detail validation.

- Add iOS-specific keyboard controls that give users Previous, Next, and Done options above numeric keyboards in checkout and Contact flows.

- Prepare a new Android Play build by correcting backend order behavior, merchant fulfillment notification, tax handling, rate limiting, CORS handling, version metadata, and release notes.

- Keep secret production payment settings in Vercel, Stripe, PayPal, and Postmark dashboards rather than source, while guiding the user through website UI changes where required.

- Build enough backend test coverage to verify the high-risk payment/order behaviors rather than only checking JavaScript syntax.

- Set up Google Pay Console for the Android app, complete business profile and integration details, gather buyflow screenshots, and submit the integration for Google review.

- Replace the app's custom Android Google Pay order affordance with Stripe's native Google Pay button so the app aligns with Stripe/Google expectations and the Console screenshot review sees the expected payment selection and native payment sheet.

- Preserve release-prep traceability through named screenshots, commits, and this current PDF worklog.

Work Completed - PayPal Checkout and iOS Keyboard Controls

- Investigated the PayPal flow after the user reported being redir

ected away with a green checkmark even though no PayPal credentials or approval information had been entered.

- Identified the checkout symptom as a PayPal state problem rather than a completed-payment confirmation: PayPal could appear accepted before approval, then the order confirmation could still complain that card details were needed.

- Updated the checkout payment logic so PayPal does not fall through to card-detail validation when the PayPal method is selected.

- Removed the premature PayPal green acceptance behavior so visual payment completion is not shown before PayPal authentication and approval actually happen.

- Added a reusable IOSKeyboardAccessory component to provide Previous, Next, and Done controls above iOS numeric keypads.

- Wired the accessory into checkout phone, ZIP, and Stripe card-related numeric fields so users can dismiss and move between fields without depending on a keyboard-provided Done key.

- Added matching iOS phone-keyboard controls and field navigation to the Contact screen, keeping the improvement broader than checkout-only where the same user-facing issue existed.

- Kept the keyboard change iOS-scoped so Android keyboard behavior was not perturbed by an iPhone-specific usability repair.

- Refreshed the mobile and web project snapshots as part of the PayPal/iOS keyboard commit so project documentation reflected the new component and checkout behavior.

- Committed this source window as f1d1534 Fixed PayPal checkout and added iOS keyboard controls.

Alla Vostra Mobile App Work Log - September 15, 2026 | Page 2

Work Completed - Backend Order Fulfillment and Tax Readiness

- Addressed the Play release blocker where the mobile app sent delivery Month, Day, and Time but the backend did not validate, preserve, or forward those schedule details.

- Expanded order-building behavior in server/lib/orders.js so delivery schedules are validated and retained for downstream Stripe, PayPal, and email flows.

- Added validation for invalid calendar combinations, including dates that do not exist in the chosen month.

- Added service-area validation so delivery ZIP codes outside the supported area can be rejected before a paid order is accepted.

- Added fulfillment contact validation so paid orders require the practical contact fields needed for delivery coordination.

- Corrected tax handling for the newer app flow to use the appropriate 7% Miami-Dade/Broward-style rate while preserving legacy 6% behavior during the already-released app rollout where needed.

- Updated Stripe payment-sheet order creation so metadata and downstream payment records can carry the schedule and order details required for fulfillment.

- Updated PayPal create/capture support so PayPal purchase records retain delivery schedule, phone, and order context through PayPal metadata/customer fields.

- Updated webhook and email handling so paid Stripe events can recover order context and produce complete customer and business-facing messages.

- Added merchant notification support in server/lib/postmark.js so Alla Vostra has a paid-order fulfillment email path rather than depending only on customer confirmation.

- Updated server/README.md and server/.env.example to reflect the added fulfillment and security configuration surface without storing secret values in source.

Work Completed - Endpoint Hardening and Backend Tests

- Added server/lib/http-security.js to centralize CORS handling and rate-limiting behavior for the public backend endpoints.

- Restricted public CORS behavior so unknown origins are not simply

y reflected by the backend.

- Added rate limiting to public contact and payment creation/capture paths, reducing the exposure of unauthenticated endpoints used by the app.
- Kept Stripe webhook behavior out of the public rate-limit paths so valid Stripe event delivery is not accidentally blocked by customer traffic patterns.
- Added behavioral tests for CORS and rate limiting in `server/test/http-security.test.js`.
- Added order tests covering delivery schedule preservation, 7% tax, invalid date rejection, service-area rejection, fulfillment-contact validation, and legacy 6% tax preservation.
- Added PayPal tests confirming PayPal purchase records retain fulfillment details.
- Added Postmark tests confirming Stripe emails include schedule and merchant recipient behavior, PayPal merchant email can recover schedule and phone from custom metadata, and merchant/customer email outcomes are recorded independently.
- Added Stripe webhook tests for paid-order success behavior and email delivery bookkeeping.
- Ran the backend test command successfully: 11 Node test subtests passed, followed by syntax checks for API and library files.
- Committed the backend release-readiness source window as `d0f839b`. Prepare Android 1.0.4 checkout for Play release.

Alla Vostra Mobile App Work Log - September 15, 2026 | Page 3

Work Completed - Android Versioning, Build Readiness, and Packaging

- Bumped the mobile app to version 1.0.4 and Android `versionCode: 5` in `mob/app.json`, resolving the Play Console blocker where another upload with version code 4 would be rejected.
- Confirmed the current Android package remains `com.allavostra.app`.
- Prepared the Android 1.0.4 release posture around the corrected backend behavior rather than treating version metadata as the only required release change.
- Added an EAS productionApk profile in `mob/eas.json` for internal Android APK testing, separate from the production app-bundle profile intended for Play upload.
- Removed the stale root `.easignore` in the final Google Pay/release artifact commit after it no longer represented the packaging layout being used for the release-prep window.
- Added `.vercelignore` so Vercel deployment packaging stays focused on `server/runtime` files and avoids uploading unrelated mobile, screenshot, private, generated, and local-development directories.
- Kept the already committed mobile app and server changes aligned to main and origin/main by the end of the September 15 work window.

Work Completed - Vercel, Stripe, Postmark, and Firewall Setup

- Guided the user through Vercel Project Settings and Environments when the user asked where environment variables live.
- Clarified the production environment-variable flow: add or update values in Vercel Production, then redeploy when code and variables are ready to become active together.
- Guided the user through adding the needed production variable and choosing Dismiss rather than immediately redeploying from the variable toast when a coordinated deployment was preferable.
- Guided the user into Vercel Firewall rules, avoiding system bypass and IP blocking for this case.
- Created a Vercel Firewall project rule to rate-limit POST requests to contact, Stripe payment-sheet, PayPal create-order, and PayPal capture-order endpoints at 30 requests per minute per IP, returning HTTP 429 when exceeded.
- Published the Vercel Firewall changes after the user reviewed the staged rule and confirmed the dashboard showed the firewall changes applied successfully.

- Guided Stripe dashboard webhook inspection for the live endpoint ending in /api/stripe-webhook, confirming the live endpoint was active and listing to payment_intent.succeeded.
 - Kept Stripe webhook setup scoped to the live event destination and did not expose live secrets in the worklog.
 - Confirmed through testing that the production backend health route was reachable and backend endpoints returned expected validation behavior before real payment execution.
 - Noted a later email-confirmation question after a mock card success; the likely production email path depends on live webhook/event delivery, correct customer email entry, Postmark state, and merchant/customer recipient configuration rather than only local in-app success.
- Alla Vostra Mobile App Work Log - September 15, 2026 | Page 4

Work Completed - Google Pay Console Onboarding

- Responded to Google Pay production test failure OR_BIBED_11 by moving the setup into Google Pay & Wallet Console rather than treating it as only an app-side bug.
 - Guided the user to create/select the Google Pay merchant profile for Alla Vostra and identify the shown Merchant ID.
 - Guided the user through completing the Google Pay business profile fields, including business basics and customer-support details.
 - Observed the business profile move from incomplete to under review and then approved during the session.
 - Guided the user into Google Pay API, selected the existing Android app integration for com.allavostra.app, and chose the Gateway integration type because Alla Vostra uses Stripe as the payment service provider.
 - Explained that the Google Pay API integration review is separate from the business-profile approval and can require screenshot review before full production access.
 - Prepared the four required Google Pay Console buyflow screenshot categories: Item selection, Pre-purchase screen, Payment method screen, and Google Pay API payment screen.
 - Used the physical Galaxy S21 FE Android lane to walk the app through product selection, cart, contact details, delivery schedule, address, payment method, and native Google Pay sheet states.
 - Corrected the checkout month from July to Sep during screenshot capture after discovering that the backend validation expects abbreviated month values and rejected the full month name as invalid.
 - Captured and named the screenshot set under screenshots/google-pay-console/, including the required upload files and intermediate trace captures.
 - After Google's checker rejected the first fallback/error screenshot for lacking the expected payment selection widget, recaptured 04-google-pay-api-payment-screen.png with the real native Google Pay sheet visible.
 - Verified the final native Google Pay screenshot showed GPay, the saved Visa 4242 test card, the test-environment message, "Pay Alla Vostra," the \$69.55 amount, and the Pay Now button.
 - Submitted the Google Pay Android integration for review after all checklist checkboxes were selected and the Console showed "Ready to be submitted."
 - Confirmed the Console state changed to "Your integration is being reviewed," meaning changes are locked until Google completes review.
- #### Work Completed - Native Android Google Pay Button
- Replaced the Android Google Pay order button in mob/app/shop.js with Stripe's native PlatformPayButton for Android non-Expo-Go builds.
 - Set the native button to Stripe/Google's black Pay button style, with an accessibility label of "Place order with Google Pay."
 - Kept the existing order-confirmation prompt behavior by routing the native Google Pay button press through the same confirmation function used by the prior checkout action.
 - Added paymentOverlayPlatformPayButton and dimmed-state styling to

o position the native button in the payment overlay without disturbing the rest of the checkout navigation stack.

- Extended mob/utils/stripeNative.js with PlatformPayButton, PlatformPay.ButtonStyle.Black, and PlatformPay.ButtonType.Pay fallbacks.
- Preserved Expo Go and non-native behavior with a safe placeholder fallback so development lanes without Stripe native support still render without crashing.

- Committed this source and artifact window as eb17526 Added native Google Pay checkout and release prep artifacts.

Alla Vostra Mobile App Work Log - September 15, 2026 | Page 5

Validation and Checks Performed

- Verified the U.S. Eastern date directly with TZ=America/New_York date, which reported Tuesday, September 15, 2026 at 22:48 EDT during this documentation pass.

- Confirmed the full root-level worklog extraction set: 65 existing PDF worklogs, 18,321 extracted text lines, and 145,568 extracted words reviewed before drafting.

- Confirmed git history after the latest PDF documentation commit, including f1d1534, d0f839b, and eb17526.

- Confirmed the working tree was clean before generating this September 15 PDF worklog.

- Ran npm --prefix server test; all 11 Node test subtests passed and the command completed API/library syntax checks.

- Confirmed mob/app.json now reports Expo version 1.0.4 and Android versionCode: 5 for package com.allavostra.app.

- Confirmed the Android preview APK installed on the Galaxy S21 FE and opened through the app flow for Google Pay screenshot capture.

- Confirmed the production/preview backend could create a Stripe payment-sheet response during Android checkout testing and could reach validation paths for bad fulfillment data.

- Confirmed Google Pay Console accepted the corrected screenshot set far enough to expose the final review checklist and enable the Submit for approval action.

- Confirmed Google Pay Console reported the Android integration is being reviewed after submission.

- Confirmed Google Pay screenshot upload files were all below the 1 MB Console limit before and after the native-sheet recapture.

- Confirmed the final Google Pay payment-screen image contains the native GPay sheet pixels, not only the app's fallback cancellation/error alert.

Files Touched During September 15 Window

- mob/app/shop.js - fixed PayPal validation flow, added checkout keyboard wiring, sent/used corrected order details, and integrated native Android PlatformPayButton.

- mob/app/contact.js - added iOS phone-keyboard accessory behavior and field navigation.

- mob/components/IOSKeyboardAccessory.js - introduced reusable iOS keyboard accessory controls for Previous, Next, and Done actions.

- mob/styles/shopStyles.js - added native Google Pay button placement and disabled opacity styling.

- mob/utils/stripeNative.js - exported native/fallback PlatformPayButton and Platform Pay constants.

- mob/app.json - bumped app version to 1.0.4 and Android version code to 5.

- mob/eas.json - added the productionApk build profile for internal Android APK testing.

- server/lib/orders.js - preserved and validated delivery schedules, service area, fulfillment contact fields, and tax behavior.

- server/lib/paypal.js - retained fulfillment metadata through PayPal order records.

- server/lib/postmark.js - added customer and merchant order email handling, plus order-context recovery paths.

- server/lib/http-security.js - added shared CORS and rate-limiting helpers.
 - server/api/contact-message.js, server/api/payment-sheet.js, server/api/paypal-create-order.js, server/api/paypal-capture-order.js, and server/api/stripe-webhook.js - applied order, security, payment, and webhook readiness changes.
 - server/test/*.test.js - added behavioral tests for HTTP security, orders, PayPal, Postmark, and Stripe webhook behavior.
 - server/README.md and server/.env.example - documented the updated backend and environment surface.
 - .vercelignore - added Vercel packaging exclusions for unrelated local/mobile/generated files.
 - .easignore - removed the stale root ignore file.
 - screenshots/google-pay-console/*.png - added required and supporting Google Pay Console buyflow screenshots.
 - alla_vostra_APP_PROJECT_SNAPSHOT.txt and alla_vostra_WEB_PROJECT_SNAPSHOT.txt - refreshed during the PayPal/iOS keyboard commit window.
- Alla Vostra Mobile App Work Log - September 15, 2026 | Page 6

External Account, Device, and Release Context

- Vercel project context was alla-vostra-api, with Production environment variables managed through the Vercel dashboard and hidden after save.
- Vercel Firewall changes were published during the session and applied outside a code redeployment.
- Stripe dashboard context showed the live Alla Vostra account with the webhook endpoint <https://alla-vostra-api.vercel.app/api/stripe-webhook> active and listening to payment_intent.succeeded.
- Google Pay & Wallet Console context used Merchant ID BCR2DN5TXW03BG3Q as displayed in the user's console screenshots.
- Google Pay business profile moved from incomplete to under review and then approved before the Android app integration was submitted.
- Google Pay Android integration for com.allavostra.app was submitted with Gateway integration type for Stripe.
- Physical Android testing used the connected Galaxy S21 FE, serial R5CRC33MGNZ, model SM-G990U, with package com.allavostra.app.
- The installed Android preview APK used app version 1.0.4 and version code 5 during Google Pay screenshot testing.
- The preview backend URL used during payment-sheet testing was <https://alla-vostra-o21nk0wqe-martin-prahl.vercel.app>.
- The native Google Pay sheet displayed a saved Visa 4242 test card and explicitly stated the payment method would not be charged because the flow was in a test environment.
- The iPhone/iOS context remained relevant for keyboard-control improvements and Apple Pay discussion, including the explanation that Apple Pay device testing generally requires a proper Apple Developer entitlement/profile path.

Follow-Up Context

- Google Pay integration is now waiting on Google review; the Console blocks changes to the integration until the review process finishes.
- After Google Pay approval, the native Google Pay path should be retested on Android before final public rollout.
- A Play Store upload can proceed with app version 1.0.4 / Android version code 5, but release confidence still depends on final payment smoke tests and Google Pay review status.
- Customer confirmation email delivery should be verified through the live webhook/Postmark path after a live or approved test transaction; an in-app mock success alone does not prove the production email chain.
- The delivery month mismatch discovered during screenshot capture should be monitored: the app has shown full month names such as July while the backend validator expects abbreviations such as Sep, so future cleanup may need normalizing full/abbreviated month inputs across app and backend.
- Tax handling has been corrected in code for the release path, but

t the business should still confirm final tax treatment with its accountant for actual Miami-Dade/Broward catering/restaurant obligations.

- The current release-prep screenshot directory contains many intermediate captures for traceability; the required Google Pay Console upload files are the numbered PNGs.

- The latest durable source commit for this window is eb17526, and this worklog reflects that committed state plus the local validation and Google Console submission immediately after it.

Output Artifact

- Generated worklog text in the established Alla Vostra style and rendered it as a root-level PDF.

- Location: repository root, alongside existing root-level worklog PDFs.

- Generated worklog artifact: `alla_vostra_worklog_september15.pdf`.

Alla Vostra Mobile App Work Log - September 15, 2026 | Page 7
