

Alla Vostra Mobile App Work Log - August 10, 2026 (Part 3)

Compiled summary for Monday, August 10, 2026 (Part 3) - focus: post-Part-2 Play Store screenshot typography and device-frame polish, Play Store 2 spacing and headline alignment, Play Store 3 frame unification, Play Store 4 center-frame reference cleanup, camera/island removal, final/trim image regeneration, snapshot refresh, commit sync, and current documentation artifact generation for Alla Vostra.

Generated in continuity with the established Alla Vostra worklog cadence: compact opening summary, source-material review, baseline, goals, grouped work-completed sections, validation, files touched, follow-up context, and output-artifact close.

This artifact is named `alla_vostra_worklog_august10_part3.pdf` because the repository already contained August 10 Part 1 and August 10 Part 2 worklogs before this documentation pass. It records the work window after the Part 2 worklog commit `f978c6f`, through the current synced source state at `20e3475`.

Source Material Reviewed

- Synced the repository with origin and confirmed main was already up to date before generating this artifact.
- Reviewed the full root-level project worklog set, including the May, June, July, August 1, August 10 Part 1, and August 10 Part 2 PDFs, to preserve naming, section order, density, and root-level output conventions.
- Used `alla_vostra_worklog_august10_part2.pdf` as the closest style anchor because it was the immediately preceding session worklog and used the current Codex standard-library PDF metadata and footer format.
- Checked the latest commit window with `git log` and `git show`, using `f978c6f..20e3475` as the source range for this Part 3 narrative.
- Inspected the current Play Store screenshot export set under `docs/play-store/screenshots/final`, with emphasis on Play Store 2, Play Store 3, Play Store 4, and Play Store 5 full and trim PNGs.
- Confirmed the refreshed snapshot files, `alla_vostra_APP_PROJECT_SNAPSHOT.txt` and `alla_vostra_WEB_PROJECT_SNAPSHOT.txt`, were part of the latest synced screenshot-polish commit.
- Reviewed the prior user-directed visual sequence that moved from TT Fors typography matching into spacing, headline shadow, device-frame depth, smoother device corners, and final removal of camera/island obstructions.

Baseline Status Before August 10 Part 3

- The repository already had two August 10 worklog artifacts. Part 1 covered the first Play Store screenshot marketing asset pass, and Part 2 covered later title text, device frame, imported real-device reference, trim export, and snapshot work.
- The source branch had advanced past Part 2 with a focused artwork commit, `20e3475` Polished Play Store screenshot artwork, which became the canonical source state for this documentation pass.
- Play Store 2 still needed visual refinement after the prior pass: the paired left/right vertical text, phone frame, and screenshot stacks were cramped, and the headline words Next-Day and Delivery needed more natural shadow and optical centering.

- Play Store 2, Play Store 3, and Play Store 4 needed consistent device-frame treatment so the screenshot interior remained below the frame chrome and frame corners stayed smooth instead of visually thinning at the screenshot edge.
- The middle device in Play Store 4 was treated as the visual reference for smoother corner behavior and real-device polish, even as the final request expanded cleanup to every relevant phone in Play Store 2, 3, and 4.
- The top camera or black landscape-triangle obstruction still appeared over the screenshot area in the affected Play Store 2, 3, and 4 composites and needed to be removed without changing established layout intent.
- Final and trim export conventions were already established: 1920x1080 full-size images and 1536x1080 trim-lr10 variants in the final screenshot directory.
- No mobile app runtime, web runtime, backend schema, or release pipeline behavior was in scope for the Part 3 source work; this was a visual asset and documentation continuation.

Goals for August 10 Part 3

- Study playstore1.png and match the appropriate TT Fors font weight across Play Store 2, Play Store 4, and Play Store 5 while preserving existing font sizes, text placement, alignment, and export composition.
- Increase the horizontal gap between the left and right vertical text/device-frame/screenshot stacks on both Play Store 2 exports by 50 percent, avoiding a cramped read while keeping the established overall design intact.
- Tune the Play Store 2 headline treatment so Next-Day retained a drop shadow comparable to Delivery, Delivery moved slightly right for optical centering, and Next-Day moved 4px left per final direction.
- Apply the smoother Play Store 4 middle-device corner look across every screenshot in Play Store 2, Play Store 3, and Play Store 4, without flattening or reversing the agreed depth order.
- Remove the camera/black-landscape-triangle obstruction from every Play Store 2, Play Store 3, and Play Store 4 phone screen while preserving screenshot visibility, phone placements, and trim dimensions.
- Refresh the project snapshots after the final image output and commit the visual work before producing the next customary PDF worklog.

Work Completed - Play Store 2 Typography, Spacing, and Headline Refinement

- Studied playstore1.png as the reference for the TT Fors weight used in the Play Store screenshot family, then applied that typographic weight to the Play Store 2, Play Store 4, and Play Store 5 assets.
- Kept the user-specified constraints around typography intact: font size, alignment, and placement were not intentionally redesigned while the weight/style match was applied.
- Regenerated both Play Store 2 outputs after increasing the horizontal gap between the right and left vertical stack groupings by 50 percent, preserving the existing stacked-phone composition while giving it more breathing room.
- Reduced the excessive shadow originally around Next-Day, then restored enough depth so the word matched the look of Delivery rather than becoming visually flat.

- Moved Delivery about 5-10px to the right to improve perceived horizontal centering inside the Play Store 2 headline lockup.
- Moved Next-Day 4px to the left after the Delivery adjustment, preserving the final requested headline balance across the full and trim Play Store 2 outputs.
- Regenerated playstore2.png and playstore2_trim-lr10.png together so the trim file remained a paired export rather than an independent design fork.

Work Completed - Device Frame Depth, Smooth Corners, and Play Store 3 Inclusion

- Reworked device frame compositing so screenshot imagery sits beneath the frame treatment and frame chrome stays visually shallower/on top where that depth order had been established.
- Started from the user-identified smoother device-frame look in the middle Play Store 4 phone, then applied that corner-rounding behavior broadly after it became clear the visible issue was not only the imported frame asset itself.
- Adjusted phone frame corner rounding so the screenshot edge no longer made the device look thinner at the corners, especially in areas where the screen content met the rounded aperture.
- Expanded the frame/corner unification scope to Play Store 3 after the user clarified that every device frame corner in Play Store 2, Play Store 3, and Play Store 4 should match the smoother Play Store 4 reference feel.
- Preserved the established depth order while applying the smoother frame treatment, rather than using the frame change as a reason to recompose the stacks or alter the intended overlap hierarchy.
- Regenerated Play Store 3 full and trim exports with the revised frame style, while keeping its screenshot art, layout rhythm, and final export naming aligned to the existing convention.
- Left unrelated Play Store assets outside the requested frame-unification scope alone, except for the earlier TT Fors weight work explicitly requested for Play Store 5.

Work Completed - Camera and Island Removal Across Play Store 2, 3, and 4

- Removed the black camera, island, or landscape-triangle obstruction from every affected phone screenshot in Play Store 2, Play Store 3, and Play Store 4.
- Included the Play Store 4 center device in the final obstruction-removal pass after the user clarified the camera/island asset was obscuring the top of the screen across the whole relevant set.
- Maintained the screenshot-under-frame order while removing the obstruction, so the cleanup did not expose raw screenshot edges above the frame or create a new top-screen artifact.
- Preserved the already-established phone positions, headline treatments, background colors, shadows, and trim behavior while removing the top-of-screen occluder.
- Regenerated the full and trim Play Store 2, Play Store 3, and Play Store 4 assets together, making the final directory internally consistent across each changed image pair.

Work Completed - Export Pairing and Asset Boundaries

- Kept the Play Store image work concentrated in docs/play-store/screenshots/final, matching the existing final-export directory rather than adding a parallel output location.
- Preserved the paired full/trim export relationship for every changed screenshot, so each trim-lr10 file remained tied to its corresponding 1920x1080 source image.
- Carried Play Store 2 spacing and headline refinements into both the full image and trimmed image, avoiding the prior common failure mode where the trim looks correct but the full asset drifts.
- Carried Play Store 3 frame-corner and camera cleanup into both image sizes, keeping the newly included frame-unification work consistent across the store-art set.
- Carried Play Store 4 side-device and center-device cleanup into both image sizes, including the final removal of the top-of-screen obstruction from the center reference phone.
- Kept Play Store 5 changes limited to the TT Fors typography treatment requested for that asset, leaving its device-frame and camera cleanup outside this narrower Part 3 scope.
- Avoided changing app code, web code, data models, Firebase rules, release configuration, or user-facing runtime copy while performing the static screenshot-art pass.
- Preserved the existing source naming pattern for the screenshot files, which keeps downstream app-store submission references and documentation references stable.

Work Completed - Project Snapshots, Commit, and Sync

- Refreshed alla_vostra_APP_PROJECT_SNAPSHOT.txt and alla_vostra_WEB_PROJECT_SNAPSHOT.txt so the textual project snapshots reflected the current screenshot asset state after the image work.
- Committed the final visual work as 20e3475 Polished Play Store screenshot artwork, with the changed Play Store PNGs and refreshed snapshots included in that source commit.
- Synced the branch with origin/main and confirmed main was aligned with origin/main before beginning the Part 3 worklog generation pass.
- Kept this documentation artifact separate from the prior source commit so the PDF records the completed, synced state rather than mixing the worklog into the visual-change commit.

Validation and Checks Performed

- Ran git pull --ff-only after the user requested syncing; Git reported the repository was already up to date.
- Ran git status --short --branch and confirmed the source branch was aligned as main...origin/main before generating this PDF artifact.
- Reviewed git log --oneline --decorate -5 to confirm the latest source commit sequence: 20e3475 after the August 10 Part 2 worklog commit f978c6f.
- Reviewed the latest commit metadata and file list for 20e3475, confirming it changed the Play Store 2, 3, 4, and 5 final/trim PNGs plus both project snapshot files.
- Verified current image dimensions with sips: Play Store 2, 3, 4, and 5 full exports are 1920x1080, and their trim-lr10 exports are 1536x1080.

- Verified the generated PDF metadata and page sizing after render with pdftinfo, including letter page size and the standard-library creator/producer convention.
- Extracted generated PDF text with pdftotext after render to confirm the title, opening sections, footer flow, final output-artifact section, and artifact filename were readable.
- Did not run Expo, EAS, Firebase, app runtime, or web runtime tests because this source window changed static marketing screenshot assets and documentation rather than executable application behavior.

Files Touched During August 10 Part 3

- alla_vostra_APP_PROJECT_SNAPSHOT.txt - refreshed app-side snapshot after the screenshot asset polish pass.
- alla_vostra_WEB_PROJECT_SNAPSHOT.txt - refreshed web/project snapshot context after the screenshot asset polish pass.
- docs/play-store/screenshots/final/playstore2.png - regenerated with TT Fors weight match, wider stack gap, tuned headline shadow/positioning, smoother frame corners, corrected depth, and removed camera/island obstruction.
- docs/play-store/screenshots/final/playstore2_trim-lr10.png - regenerated trim pair for the final Play Store 2 image.
- docs/play-store/screenshots/final/playstore3.png - regenerated with smoother Play Store 4-style frame corner behavior and removed top camera/island obstruction.
- docs/play-store/screenshots/final/playstore3_trim-lr10.png - regenerated trim pair for the final Play Store 3 image.
- docs/play-store/screenshots/final/playstore4.png - regenerated with smoother frame/corner consistency, preserved middle-device reference quality, and removed top camera/island obstruction across the relevant phones.
- docs/play-store/screenshots/final/playstore4_trim-lr10.png - regenerated trim pair for the final Play Store 4 image.
- docs/play-store/screenshots/final/playstore5.png - regenerated with the TT Fors weight treatment requested for the Play Store 5 typography pass.
- docs/play-store/screenshots/final/playstore5_trim-lr10.png - regenerated trim pair for the final Play Store 5 image.
- alla_vostra_worklog_august10_part3.pdf - generated after syncing and reviewing the pre-existing worklog library, to document the post-Part-2 source window.

Follow-Up Context

- The current synced source truth for the visual work is commit 20e3475 on main/origin/main, with this Part 3 PDF produced afterward as the latest documentation artifact.
- Future Play Store screenshot edits should treat the smoother Play Store 4 middle-device frame feel as the device-corner reference, while preserving screenshot-under-frame depth and avoiding reintroduced camera/island obstructions.
- When additional final images are produced, the paired trim-lr10 exports should continue to track the established 1536x1080 trim convention beside the 1920x1080 full export.
- Any future typography work should preserve the Play Store 1 TT Fors weight relationship unless a later brand or app-store art direction update replaces it.

- Runtime release readiness was unchanged by this worklog window; app-store asset review remains the relevant next verification lane for these files.

Output Artifact

- Generated this PDF after syncing the repository, reviewing all pre-existing root-level Alla Vostra worklogs, checking recent worklog metadata with pdftinfo, and anchoring the narrative to the f978c6f..20e3475 source window.
- Rendered as a letter-size, root-level PDF using the same standard-library generator convention as the recent worklogs, including title metadata, subject metadata, creator/producer metadata, and per-page footers.
- Placed the artifact at the repository root alongside the existing Alla Vostra worklog series.
- Generated worklog artifact: `alla_vostra_worklog_august10_part3.pdf`.
