

Alla Vostra Mobile App Work Log - July 7, 2026 (Part 2)

Compiled summary for Tuesday, July 7, 2026 (Part 2) - focus: post-Part-1 Shop product-overlay layout refinement, proportional horizontal distribution for the paragraph/Add/counter row, responsive vertical distribution between the orange cream-area banners, and the new Sei Perfetto product badge.

Generated automatically after reviewing the July 7 Part 1 worklog PDF, nearby daily worklog PDFs, the post-Part-1 Git commit, current mobile source state, local syntax and whitespace checks, and the Android Small/Large emulator screenshots captured during the product-overlay tuning pass.

Includes tracked Git work from commit 2e2109d, completed after the July 7 Part 1 worklog. That commit reorganized the product overlay so its vertical stacks and horizontal asset lanes respond more consistently across Android Small, physical Android Standard, and Android Large testing targets.

Source Materials Processed

- Read the July 7 Part 1 root-level worklog PDF with pdftotext to preserve the established same-day part naming, compact opening summary, source-material section, baseline section, goal list, work-completed sections, validation section, files-touched list, follow-up context, and output-artifact close.
- Read the July 6 and July 5 root-level worklog PDFs to keep the Part 2 artifact aligned with the existing daily style, page count, bullet-heavy structure, and plain-text-readable PDF output convention.
- Reviewed post-Part-1 Git history, especially commit 2e2109d, which touched mob/app/shop.js and mob/styles/shopStyles.js for product-overlay horizontal and vertical responsive layout work.
- Checked current repository state before PDF generation. The working tree was clean before this artifact was created; the source changes described here were already tracked in commit 2e2109d.
- Reviewed current source context in mob/app/shop.js and mob/styles/shopStyles.js, including the product overlay product-name stack, image/chevron stack, paragraph/Add/counter row, badge text mapping, product overlay style declarations, and the current proportional lane constants.
- Reviewed available emulator screenshot artifacts from the session:
/tmp/alla-vostra-small-product-overlay-vertical-even.png,
/tmp/alla-vostra-large-product-overlay-vertical-even.png, and
/tmp/alla-vostra-small-sei-perfetto-new-badge.png.
- Used git log, git show --stat, git show --name-only, git status --short, rg, sed, pdftotext, pdfinfo, node --check, git diff --check, adb-driven screenshot context from the session, and a small standard-library PDF writer; no external PDF package was installed.

Current Baseline to Preserve

- Primary app work remains in /Users/prahlin/alla_vostra/mob, using Expo Router, React Native, shared Shop cart context, Stripe payment integrations, Postmark-backed server flows, and the established Alla Vostra mobile visual system.
- The Android test matrix remains the same as Part 1: the physical Android device is the standard-format reference, AllaVostra_Small_Android_API_34 is the cramped short-phone check, and AllaVostra_Large_Android_API_35 is the tall/large-spacing check.
- The Shop product overlay is now treated as a cream-area layout system bounded by orange top and bottom banners. Those orange bands are the visual reference edges for vertical distribution.
- Inside the product overlay, internal stack appearance should be preserved: product-name text remains its own stack, the chevron/image/chevron row keeps its own internal geometry, and the paragraph/Add/counter row keeps its internal button/counter relationships.
- Future product-overlay edits should avoid reintroducing absolute horizontal offsets that make the counter depend on the Add-button frame. The current baseline is proportional sibling columns inside the product-info row.
- The 20 percent Small Android cream-area scaling from Part 1 remains in effect. Part 2 did not broaden that rule; it reorganized the product overlay content within the already established responsive scale system.

Main Goals We Worked Toward

- Remove the excessive right-side margin after the counter on Android Small and Android Large while keeping the physical Android Standard layout from drifting away from its already acceptable appearance.
- Protect the product overlay side padding while distributing only the named internal assets: paragraph, gap, Add-button stack, gap, and counter stack.
- Replace old width caps and inherited action-column offsets with responsive percentages so the

product-info row behaves predictably on Small, Standard, and Large Android.

- Distribute the three main product-overlay vertical stacks evenly from top to bottom within the cream area, using the orange top and bottom banners as the layout boundaries.
- Avoid changing vertical properties between assets inside a particular stack. The goal was to move stack groups, not to redesign the internal relationships of the name, image, paragraph, Add button, price, or counter controls.
- Add useful badge consistency for products that otherwise had an empty badge slot, specifically placing NEW over the Sei Perfetto Add button in blue.

Work Completed - Horizontal Product Row Proportions

- Investigated the product overlay paragraph/Add/counter row after Android Small and Android Large showed too much right-hand margin beyond the counter compared with the left margin beside the product paragraph.
- Identified that the previous row math capped the paragraph independently and positioned the counter as an absolute offset from inside the Add-button frame, which made the visible right edge behave differently across device sizes.
- Replaced the ad hoc row calculation with responsive proportional lanes inside the protected side padding. The final proportions are paragraph 60 percent, first gap 3 percent, Add-button stack 25 percent, second gap 3 percent, and counter stack 9 percent.
- Kept the left/right padding rule separate from the internal lane distribution. The correction was to distribute the mentioned assets inside the row, not to let the counter encroach into or redefine the product-overlay padding.
- Changed the Add-button stack and counter stack into sibling layout columns instead of leaving the counter nested as a sideways absolute child of the Add-button frame.
- Centered the Add button inside its 25 percent lane with a computed left offset, preserving the existing Add button size and the POPULAR/price vertical relationship inside that stack.
- Centered the counter inside its 9 percent lane and retained a defensive fit calculation so the counter does not invade the right-side padding if future scale/device values become tighter.
- Removed the old assumption that the paragraph, Add stack, and counter should be balanced by leftover width. The new row is driven by explicitly named proportional regions, which makes future adjustment more intentional.

Work Completed - Iterative Spacing Decisions

- First attempted to reserve the visible counter width so the right edge would stop floating with a large blank strip on Small and Large Android.
- Then matched the row right reserve to the overlay screen-edge margin, which restored breathing room but still did not fully express the intended asset-level proportions.
- Tested doubled horizontal side spacing, then narrowed the focus after review: the left/right padding should stay protected, while the paragraph, Add stack, and counter stack should be distributed inside that padding.
- Tested a 60 / 5 / 25 / 5 / 5 layout, then rejected it because the counter lane was too narrow and forced the counter stack to scale down too much.
- Tested a 60 / 4 / 25 / 4 / 7 layout, then moved to 60 / 3 / 25 / 3 / 9 so the counter retained more visual weight without overrunning the right padding.
- Kept each proportion change in one place, derived from the measured row content width, so later visual tuning can change percentages without hunting through nested style offsets.

Work Completed - Counter and Add Stack Behavior

- Kept the counter visually connected to the Add stack while giving it its own proportional lane, so the paragraph, button stack, and counter can align consistently across Android Small, Standard, and Large.
- Preserved the counter stack internals: up triangle, number box, down triangle, optional confirmed check state, shadow plate, muted styling, and existing press handlers for increment/decrement behavior.
- Preserved Add button behavior: tapping Add still initializes quantity when needed and confirms the selected product; existing green button styling and tapped/added states remain in place.
- Kept the Add stack internals together: badge text, Add button, and price retain their original vertical relationship inside the 25 percent Add-button lane.
- Kept the product row responsive by deriving each lane from the measured product-overlay row content width rather than hard-coding separate Small/Large coordinates.
- Retained a scale-to-fit guard for the counter stack as a safety valve, but the final 9 percent lane gives the counter enough space to avoid the overly tiny appearance seen in the 5 percent experiment.

Work Completed - Vertical Cream-Area Distribution

- Adjusted the product overlay body so its major content groups are distributed evenly through the cream area bounded by the orange top and bottom banners.
- Split the previous combined product-name-and-image wrapper into separate sibling stacks. The three vertical stacks are now product name, chevron/image/chevron, and paragraph/Add/counter.
- Changed the product overlay body justification to space-evenly so the three stack groups spread across tall and short cream areas without changing the internal spacing of the named assets inside each group.
- Kept the product name typography, image size, chevron row, paragraph line-height, Add button placement within its stack, price placement, and counter internals visually intact while moving only the stack groups relative to each other.
- Verified that Android Large now uses its extra cream-area height by spreading the name, image stack, and info/action row rather than clustering the whole product overlay near the top.
- Verified that Android Small still fits the same three groups without reintroducing the earlier cramped bottom-control or Small-only cream-area problems from Part 1.
- Kept the orange top and bottom bands as the vertical references. The distribution happens inside the cream content area and does not move the overlay frame or its orange banners.

Work Completed - Product Badge Updates

- Added a real badge for Sei Perfetto, replacing the previous empty badge text with NEW.
- Added `piccolaOverlayPopularTagBlue` in `mob/styles/shopStyles.js` and applied it when the active product badge text is NEW.
- Preserved Piccola behavior: Piccola still shows POPULAR in green above the Add button.
- Preserved Buon Natale behavior: Buon Natale still maps to ON SALE using the existing red/default badge treatment.
- Reviewed a Small Android Sei Perfetto screenshot and confirmed the blue NEW badge appears above the Add button while the product overlay still uses the same proportional row structure.

Validation and Checks Performed

- Freshly ran `node --check` on `mob/app/shop.js` and `mob/styles/shopStyles.js` after the product-overlay edits; no syntax errors were reported.
- Freshly ran `git diff --check` after the product-overlay edits; no whitespace or patch-format issues were reported.
- Reviewed Git history and confirmed the post-Part-1 product-overlay work is tracked in commit `2e2109d`, touching only `mob/app/shop.js` and `mob/styles/shopStyles.js`.
- Reviewed current repository status before creating this PDF. The working tree was clean before the new Part 2 worklog artifact was generated.
- Captured and reviewed Android Small and Android Large product-overlay screenshots after launching directly into Piccola via the development-client deep link.
- Captured and reviewed a Small Android Sei Perfetto screenshot after launching directly into that product overlay state to confirm NEW appears above Add in blue.
- Did not run a fresh Expo export, Play Store screenshot render, or production Android build during this PDF-generation step. The recorded validation is source syntax, whitespace checks, Git history review, and emulator visual inspection from the active development session.

Files Touched During July 7 Part 2

- Product overlay implementation and layout math: `mob/app/shop.js`. This includes proportional lane widths, separate Add/counter columns, counter fit math, product badge selection, and the split between product-name and image stack wrappers.
- Product overlay styling: `mob/styles/shopStyles.js`. This includes space-evenly body distribution, the separate image-stack wrapper style, and the blue NEW badge text style.
- No server files, payment backend routes, app-wide navigation files, Android native configuration, generated `mob/android` files, or Play Store helper assets were part of this Part 2 source change.

Follow-Up Context

- Check the product overlay on the physical Android Standard device after this Part 2 pass, because Small and Large were visually reviewed in emulators while the physical device remains the standard-format authority.
- If the counter or Add stack needs further tuning, adjust the proportional lane values rather than reintroducing absolute counter offsets from inside the Add-button frame.
- If vertical spacing needs refinement, tune the stack-level distribution or stack wrapper sizing, not the internal typography/image/button/counter spacing within a stack.
- Continue treating the orange top and bottom banners as the product-overlay cream-area boundaries for vertical product overlay layout decisions.
- Payment flows and native checkout behavior remain separate release-confidence tasks; this Part

2 work was visual/responsive Shop product-overlay layout work only.

Output Artifact

- This final worklog generation creates `alla_vostra_worklog_july7_part2.pdf` at the repository root.
- The filename uses the established root-level convention with a part suffix because this is explicitly July 7 Part 2 and follows the existing July 7 Part 1 artifact.
- No external PDF package was installed; this artifact was generated with a small standard-library PDF writer in the same plain-text-readable spirit as the prior daily worklogs.
- Created this daily worklog PDF: `alla_vostra_worklog_july7_part2.pdf`.
