

Alla Vostra Mobile App Work Log - May 30, 2026 (Part 1)

Compiled summary for May 30, 2026 - focus: mobile Expo/Android visual polish, background3.png layering and scroll behavior, main-content layout rhythm, center magnification, header arrows, swipe navigation, and top-nav screen-name transition refinement.

Generated automatically on May 30, 2026 at 4:01 PM EDT.

Source Materials Processed

- Read and processed alla_vostra_APP_PROJECT_SNAPSHOT.txt and alla_vostra_WEB_PROJECT_SNAPSHOT.txt, both generated Sat May 30 10:32:27 EDT 2026.
- Extracted and inspected all existing local worklog PDFs: May 11, May 13, May 15, May 16, May 18, May 19, May 23, May 25 Part 1, May 25 Part 2, May 26, and May 27.
- Matched the recent mobile worklog style: US-letter PDF, Helvetica/Helvetica-Bold typography, footer with worklog title and page number, concise section headings, and implementation-oriented bullet summaries.

Current Baseline to Preserve

- Work remained focused on /Users/prahlin/Desktop/alla_vostra/mob. The desktop / other website was not the active editing target for this session.
- The Expo Router mobile architecture remains the active app structure, with the persistent AppHeader mounted from app/_layout.js over Home, Products, About Us, and Contact.
- The four main screens remain ordered Home -> Products -> About Us -> Contact -> Home, with reverse navigation looping Contact -> About Us -> Products -> Home -> Contact.
- Shop remains isolated from the shared white carousel navigation row and background3.png hero behavior unless a future task explicitly changes that architecture.
- Dream Avenue, TT Fors, the orange Alla Vostra brand bar, the cream #FFFCF2 surface, and the Android radial center-shadow treatment remain part of the mobile design baseline.
- background3.png is now treated as a persistent visual underlay for the main screens, with a lowest scroll opacity of 0.1 and a matched size/position freeze once that opacity floor is reached.

Main Goals We Worked Toward

- Make background3.png more visible and intentional during loading and scrolling without creating a gap below the top nav bar or obscuring the seated people in the image.
- Ensure the orange indicator bar behaves like a carousel wraparound between Home and Contact instead of sliding visibly across the entire screen.
- Make main content screens feel more spacious, vertical, and mobile-native by reshaping image presentation, enlarging line height, and tuning divider/header spacing.
- Add a subtle center-of-screen magnification effect so images, headers, and paragraphs grow together as they pass through the vertical center of the viewport.
- Repair top-nav screen-name slide-in/slide-out behavior so outgoing and incoming names move in sync during taps, holds, and swipes from any main screen area.
- Refine the animated arrow hint rules so arrows only appear after idle time at the exact top/original header state, then hide on touch, scroll, and navigation.

Work Completed - background3.png Layering, Fade, and Scroll Behavior

- Moved the circular center shadow behind background3.png so it does not become visually obvious until the background image begins fading away during downward scroll.
- Adjusted the orange indicator wrap behavior between Contact and Home so the active orange bar exits one edge and reappears from the opposite edge rather than crossing the entire screen.
- Iterated on background3.png starting placement and visibility. Several attempts created unwanted gaps under the nav bar and were reverted; the accepted direction preserved full vertical image visibility without leaving a blank gap.

- Changed the background3.png minimum scroll opacity in stages from 0.2 to 0.15 and then to 0.1, while preserving the existing fade-in behavior when scrolling back upward.
- Matched the background3.png resize/position freeze point to the 0.1 opacity point so the image no longer continues growing or disappearing from view after reaching its lowest scroll opacity.
- Adjusted layering so main content images can appear over background3.png while text remains readable over the image when the hero underlay is visible.
- Fixed the web version so background3.png appears on web in the same general way it appears on Android.

Work Completed - Main Content Layout and Image Presentation

- Matched the top of the Home main content to Contact, About Us, and Products by adding the same initial spacing and divider treatment above the first image area.
- Doubled the vertical gaps around the first divider and later doubled the vertical gaps above and below section headers such as Passion, Taste, Convenience, and product headings.
- Made first-divider behavior fade with scroll so it does not awkwardly eclipse background3.png while the background image is fading behind it. The fade distance was shortened after the first pass felt too slow.
- Removed corner rounding from main screen images and expanded their horizontal presentation so the images no longer sit inside rounded, inset cards.
- Cropped or offset the left/right image edges in stages so the images read as more profile-oriented for mobile. After an overcrop affected top/bottom visibility, the top and bottom image content was restored while preserving the side cutoffs.
- Reduced the final image display sizes by 25% after the relative dimensions became visually correct.
- Increased paragraph line height by 50% across the main content screens to give copy a more airy, deliberate vertical rhythm.
- Fixed Products screen paragraph wrapping so product description text no longer clips outside the screen edges.

Work Completed - Center Magnification Effect

- Added CenterMagnifyView as the shared mechanism for the main content magnification effect across Home, Products, About Us, and Contact.
- Made content grow as it approaches the vertical center of the screen and return toward normal size after it passes through that center area, creating a subtle browsing-with-a-magnifier feel.
- Tuned the scroll distance and hold area after early versions felt unchanged or too abrupt. The max-size zone was reduced from a 60% viewport hold to 40%, then the maximum magnification was halved twice until the user confirmed the result as perfect.
- Changed magnification grouping so related section assets resize together. For example, the Passion image, Passion heading, and Passion paragraph now grow/reduce in sync instead of each reacting separately.
- Kept the effect subtle enough that layout rhythm remains readable while still providing a noticeable center-focus interaction during vertical scrolling.

Work Completed - Header Arrows and Idle Hint Timing

- Refined the carousel arrow hint logic after an initial attempt accidentally removed the arrows entirely.
- Arrows now appear only after 3 seconds of idling on a screen while the app header is in its original top state, with the user at the exact top of the main screen.
- Arrows hide whenever the top nav bar is tapped or held, when navigation begins, and when the user scrolls downward from the original header state.
- Matched the post-loop delay to the initial delay so the arrow animation waits 3 seconds before appearing again after completing one loop.
- Fixed the case where arrows failed to reappear after the user scrolled down and then

returned to the top/original header state and waited.

Work Completed - Top Nav Screen-Name Transition

- Added slide-in/slide-out animation for the active screen name in the white top nav bar so the outgoing name leaves through one edge and the incoming name enters from the opposite edge.
- Adjusted the animation so that by the time the outgoing screen name is 50% outside the edge, the incoming screen name is already 50% inside from the opposite side.
- Made the visual start during press-and-drag instead of waiting for the user to release the swipe. Dragging a screen name toward an edge now begins revealing the neighboring screen name immediately.
- Extended the same header-name swipe preview to swipes from the main content area, so users are not required to start the gesture on the top nav bar to see the transition.
- Created `utils/headerSwipeContext.js` and `HeaderSwipeProvider` so full-screen swipes and top-nav swipes share the same animated swipe value and committed route snapshot.
- Moved the route handoff into `useLayoutEffect` and consumed committed swipe snapshots so route-driven transitions can begin from the current drag position before paint.
- Reworked the latest refinement so previous and next screen names are always mounted offscreen and driven directly by the shared `Animated.Value` rather than conditionally appearing through React state mid-drag.
- Current note: the user reported the latest refinement is still not good enough visually, but chose to keep this version for now. The next meaningful fix likely needs a deeper animation architecture change.

Files Touched / Added During May 30 Part 1

- `mob/components/AppHeader.js` - `background3.png` opacity/scale/freeze tuning, indicator wrap behavior, header arrows, nav screen-name transition, shared swipe handoff, and route transition timing.
- `mob/styles/headerStyles.js` - center shadow layering, carousel/nav styling, and transition-related presentation details.
- `mob/app/_layout.js` - overlay/header provider wiring and `web/Android` `background3.png` parity behavior.
- `mob/utils/headerSwipeContext.js` - added shared header swipe context for cross-area gesture synchronization.
- `mob/utils/useMainScreenSwipeNavigation.js` - updated full-screen swipe handling to feed header-name visual motion and commit route snapshots.
- `mob/components/CenterMagnifyView.js` - added shared center magnification wrapper for synchronized section scaling.
- `mob/components/PageDivider.js` - first-divider fade behavior and spacing support.
- `mob/components/ScreenFade.js` - attempted/refined edge fade behavior during vertical scrolling.
- `mob/app/index.js`, `mob/app/products.js`, `mob/app/aboutus.js`, `mob/app/contact.js` - main-screen content spacing, divider placement, magnification grouping, image wrappers, and swipe handler attachment.
- `mob/styles/sharedStyles.js`, `mob/styles/productsStyles.js`, `mob/styles/aboutusStyles.js`, `mob/styles/contactStyles.js` - image presentation, text spacing, paragraph line height, header spacing, wrapping, and z-index/layering refinements.
- `alla_vostra_APP_PROJECT_SNAPSHOT.txt` and `alla_vostra_WEB_PROJECT_SNAPSHOT.txt` - regenerated/updated project snapshots earlier in the day.

Expo / Metro / Node / Git Notes

- The May 30 git history contains multiple focused commits from 11:34 AM through 3:57 PM EDT, covering `background3.png`, content layout, magnification, Products wrapping, header arrows, and swipe-navigation synchronization.
- Node syntax checks were run on the edited JavaScript files during the final header-swipe

- refinement: components/AppHeader.js, utils/useMainScreenSwipeNavigation.js, utils/headerSwipeContext.js, and app/_layout.js.
- git diff --check was run successfully against the final edited files during the last refinement pass.
 - Expo web was started on port 8082 because port 8081 was already occupied. Metro bundled successfully and http://localhost:8082 returned HTTP 200 OK.
 - Expo reported patch-version compatibility warnings for expo, expo-font, and expo-router, but the web bundle completed despite those warnings.
 - Before this PDF was generated, git status was clean; this PDF itself is the new output artifact for the worklog request.

Important Constraints Going Forward

- Do not reintroduce a visible gap between the white top nav bar and background3.png when trying to reveal more of the image.
- Keep the people at the table in background3.png vertically visible in the original/header-loaded state.
- Do not let background3.png continue resizing or shifting once it reaches its 0.1 opacity low point during downward scroll.
- Keep main content images above background3.png; only text should visually sit over the background image in the intended underlay sense.
- Do not let the orange indicator bar slide visibly across the full width when wrapping between Contact and Home or Home and Contact.
- Do not make nav arrows appear immediately after navigation, touch, or scroll. They should return only after the idle/original-header conditions are met.
- Preserve the accepted image side-crop/profile proportions and paragraph margins unless a later replacement image set requires retuning.
- Treat the current screen-name swipe animation as kept but not fully satisfying. Avoid piling more small timing tweaks onto the existing Animated/PanResponder handoff if the underlying jitter remains.

Best Next Approach

- Test the kept header-swipe version on Android Expo Go using slow drags, quick flicks, top-nav drags, and content-area swipes from each of the four main screens.
- If the screen-name transition still jitters, replace the current React Native Animated/PanResponder route handoff with react-native-reanimated plus gesture-handler, or model the header title row as one continuous carousel strip.
- Continue visual tuning one contained behavior at a time, because several May 30 changes required reversion when small spacing or fade adjustments created unintended gaps or cloud-like edge artifacts.
- When replacing content imagery later, preserve the current image container proportions first and swap assets second; the user confirmed the final relative image dimensions are correct.
