

Alla Vostra Mobile App Work Log - July 7, 2026 (Part 3)

Compiled summary for Tuesday, July 7, 2026 (Part 3) - focus: post-Part-2 Shop overlay polish, native Android toolbar dimming, product overlay paragraph/action alignment, Shop preview vertical spacing, and cart white receipt-area height tuning across Android Small, Android Standard, and Android Large targets.

Generated automatically after reviewing the July 7 Part 1 and Part 2 worklog PDFs, the Part 3 Git commits now on main, current mobile source state, local syntax and whitespace checks, and emulator screenshots captured during the Part 3 tuning pass.

Includes tracked Git work from commits 098c817, b7ed09a, 9896f5d, and 6539fff. Those commits refine the Shop overlay experience after the Part 2 product-overlay restructuring while preserving the established orange/cream Alla Vostra visual system.

Source Materials Processed

- Read the July 7 Part 2 root-level worklog PDF with pdftotext to preserve the established same-day part naming, compact opening summary, source-material section, baseline section, work-completed sections, validation section, files-touched list, follow-up context, and output-artifact close.
- Reviewed the July 7 Part 1 and July 6 worklog artifacts for the same Android test-matrix language and root-level PDF convention used in the current project history.
- Reviewed Git history for the Part 3 commits: 098c817 for Android overlay toolbar dimming, b7ed09a for product overlay action/counter vertical centering, 9896f5d for Shop preview vertical stack spacing, and 6539fff for cart overlay white-area padding correction.
- Checked current repository state before PDF generation. The working tree was clean before this artifact was created, and the source work described here was already tracked in Git.
- Reviewed current source context in mob/app/_layout.js and mob/app/shop.js, including overlay visibility state, Android status-bar tinting, product overlay measurement math, Shop preview stack measurement, cart bottom-banner height math, Add items placement, and Checkout placement.
- Reviewed the Part 3 emulator screenshot context captured during implementation, including Android Small and Android Large product-overlay, Shop preview, and cart bottom-area screenshots.
- Used git log, git show --stat, git show --name-only, git status --short, rg, sed, pdftotext, pdfinfo, node --check, git diff --check, adb-driven screenshot context from the active session, and this small standard-library PDF writer; no external PDF package was installed.

Current Baseline to Preserve

- Primary app work remains in /Users/prahlin/alla_vostra/mob, using Expo Router, React Native, shared Shop cart context, Stripe payment integrations, Postmark-backed server flows, and the established Alla Vostra mobile visual system.
- The Android test matrix remains the same: Android Small is the short/cramped phone check, physical Android Standard remains the standard-format visual authority, and Android Large is the tall/large-spacing check.
- The Shop overlay system still uses the same app header, gray underlay, orange/cream overlay shell, bottom navigation controls, product overlay, cart overlay, contact/time/delivery/payment sequence, and shared cart state.
- The July 7 Part 2 product-overlay lane structure remains the baseline: protected side padding with proportional paragraph/Add/counter lanes, internal counter geometry preserved, and product overlay groups distributed within the orange-bounded cream area.
- The July 7 Part 1 Small Android scale behavior remains intact. Part 3 did not broaden the 20 percent Small Android cream-area scaling; it tightened specific spacing and overlay visibility issues within the existing responsive system.
- The app-header gradient experiment discussed later in the session was intentionally excluded

from this artifact because those changes were reversed and are not part of the current source baseline.

Main Goals We Worked Toward

- Make the native Android top toolbar visually recede whenever the Shop overlay is active on Android Standard and Android Large, matching the underlay-dim behavior already seen on Android Small.
- Center the product overlay Add/button stack and counter stack vertically against the product information paragraph without redesigning their internal relationships.
- Evenly distribute the four Shop preview stacks - Deliciousness text, truck row, bargain row, and SoFlo row - between the bottom edge of the app header and the top of the Shop/cart button row.
- Reduce the cart overlay white receipt area on Android Small and Android Large so the top padding above Add items matches the predetermined bottom padding beneath Checkout.
- Keep the physical Android Standard appearance as the reference while correcting Small and Large drift caused by extra height, fixed minimums, and layout assumptions that did not scale cleanly.

Work Completed - Android Overlay Toolbar Dimming

- Investigated the Shop overlay state where Android Standard and Android Large kept the native top toolbar too bright while the app header and underlay were visually subdued behind the overlay.
- Changed the Android status-bar dimming condition in `mob/app/_layout.js` so every Android Shop overlay state dims the native toolbar while the Shop overlay is visible, rather than limiting that behavior to Small Android only.
- Kept the route and overlay checks intact: the dimming applies only on the Shop route while the shared Shop overlay visibility state is active.
- Preserved the existing dimmed color and status-bar style, keeping the toolbar integrated with the low-visibility underlay language instead of introducing a new toolbar treatment.
- Verified through Android Small and Android Large screenshots during the implementation pass that the native toolbar no longer pulls visual focus away from the active overlay and bottom overlay navigation controls.

Work Completed - Product Overlay Stack Centering

- Investigated the product overlay paragraph/Add/counter row after the Add stack and counter stack read visually off-center relative to the product information paragraph, especially on Android Large.
- Kept the Part 2 proportional horizontal lane layout intact: paragraph, gap, Add-button stack, gap, and counter stack remain siblings rather than nesting the counter back into the Add-button frame.
- Added measured vertical centering math based on the current product description height and the minimum action-stack height.
- Applied one shared vertical translate value to both the Add/button stack lane and the counter stack lane so the two controls move together relative to the paragraph.
- Preserved internal product overlay geometry: badge, Add button, price, up/down triangles, number box, optional confirmation check, muted states, and existing press handlers were not redesigned.
- Checked zero-quantity and selected/confirmed visual states in Android Small and Android Large screenshots to make sure the confirmation check remained separated from the Add stack and the row still fit cleanly.

Work Completed - Shop Preview Vertical Distribution

- Reworked the Shop preview content area so its four named stacks are measured and distributed through the available vertical band instead of leaving most leftover space as a final margin before the hidden in-flow action button.
- Defined the top reference as the space below the app header and the bottom reference as the top of the sticky Shop/cart button row.
- Measured the Deliciousness text height, truck row height, bargain row height, and SoFlo row height, then computed one shared responsive gap from the remaining available height.
- Applied that shared gap above the Deliciousness text, between the three image/button rows, and below the SoFlo row before the hidden measurement copy of the action button.
- Kept the visible Shop/cart bottom controls anchored to their existing sticky positions, avoiding drift in the primary bottom navigation while allowing the preview content to breathe evenly.
- Removed stale row-position bookkeeping once the new measured-stack gap calculation replaced the previous rowY/sofloY bottom measurement approach.
- Reviewed Android Small and Android Large screenshots after the change; Small retained enough room above the bottom controls, and Large used its extra height by distributing the content rather than clustering near the top.

Work Completed - Cart White Receipt-Area Padding

- Investigated the cart overlay white receipt area after Android Small and Android Large showed too much white height above the Add items button while Android Standard looked correct.
- Identified that the white banner height could be forced by a fixed minimum and by a control-height calculation that did not directly mirror the desired top and bottom button padding.
- Introduced cartOverlayBottomActionPadding as the shared padding reference for the cart action stack, currently tied to the overlay inner horizontal padding so it remains responsive with the overlay shell.
- Changed the cart white banner control height to equal top padding + Add items button + control gap + Checkout button + matching bottom padding.
- Removed the old fixed cartOverlayBottomBannerMinHeight from the deciding height calculation so Small and Large no longer inherit an awkward extra gap above Add items.
- Kept receipt content safety by still allowing cartOverlayBottomSummaryContentHeight to win if the product rows, delivery fee, taxes, and total require more vertical room.
- Aligned Checkout to the bottom orange band plus the shared action padding, then placed Add items directly above Checkout by button height plus the existing control gap.
- Verified Android Small with filled cart content and Android Large cart bottom-area screenshots; the Add items top inset now visually matches the Checkout bottom inset, and the white receipt area reads tighter and more intentional.

Validation and Checks Performed

- Freshly ran node --check mob/app/_layout.js before generating this Part 3 artifact; no syntax errors were reported.
- Freshly ran node --check mob/app/shop.js before generating this Part 3 artifact; no syntax errors were reported.
- Freshly ran git diff --check before generating this Part 3 artifact; no whitespace or patch-format issues were reported.
- Reviewed current repository status before creating this PDF. The working tree was clean before the new Part 3 worklog artifact was generated.
- Reviewed Git history and confirmed the Part 3 source work is tracked in commits 098c817, b7ed09a, 9896f5d, and 6539fff on main.
- Captured and reviewed Android Small and Android Large screenshots during the tuning pass for

- product overlay row centering, Shop preview vertical spacing, and cart receipt-area padding.
- Restarted Android Small during the session and confirmed it returned online as emulator-5554 at 720x1280, density 320.
 - Did not run a fresh Expo export, Play Store screenshot render, or production Android build during this worklog-generation step. The recorded validation is source syntax, whitespace checks, Git history review, and emulator visual inspection from the active development session.

Files Touched During July 7 Part 3

- Global layout/status-bar handling: `mob/app/_layout.js`. This includes broadening Android Shop overlay status-bar dimming so the native toolbar recedes on Android Standard and Android Large as well as Android Small.
- Primary Shop implementation and layout math: `mob/app/shop.js`. This includes product overlay action/counter centering, Shop preview measured-stack vertical spacing, cart white receipt-area height math, and Add items/Checkout padding alignment.
- Project snapshot artifacts were refreshed in commit 098c817:
`alla_vostra_APP_PROJECT_SNAPSHOT.txt` and `alla_vostra_WEB_PROJECT_SNAPSHOT.txt`.
- No server files, Stripe backend routes, Android native configuration, generated `mob/android` files, payment provider logic, app-header gradient code, or Play Store helper assets are part of the final Part 3 source baseline.

Follow-Up Context

- Physical Android Standard should remain the final visual authority for these changes, especially the cart white receipt-area height, because Small and Large were the active emulator checks during Part 3.
- If the product overlay row needs further tuning, keep moving the Add/button stack and counter stack together relative to the measured paragraph rather than changing their internal badge/Add/price/counter geometry independently.
- If the Shop preview needs more or less breathing room later, tune the shared measured-stack gap or the reference band boundaries, not one-off row margins for truck, bargain, or SoFlo.
- If the cart receipt area needs further tightening, preserve the explicit mirrored-padding relationship: Add items top padding should match Checkout bottom padding unless a future design request deliberately changes that rule.
- Continue ignoring the app-header gradient experiment for the Part 3 record because it was reversed and is not reflected in the current clean repository state.

Output Artifact

- This final worklog generation creates `alla_vostra_worklog_july7_part3.pdf` at the repository root.
- The filename uses the established root-level convention with a part suffix because this is explicitly July 7 Part 3 and follows the existing July 7 Part 1 and Part 2 artifacts.
- No external PDF package was installed; this artifact was generated with a small standard-library PDF writer in the same plain-text-readable spirit as the prior daily worklogs.
- Created this daily worklog PDF: `alla_vostra_worklog_july7_part3.pdf`.
