

Alla Vostra Mobile App Work Log - July 2, 2026

Compiled summary for Thursday, July 2, 2026 - focus: Shop overlay form-field placeholder language, delivery-address row proportions, delivery date and time controls, scrollable time toggles, Android haptic feedback, global action-button vibration, and the latest filled-cart divider spacing refinement.

Generated automatically on July 2, 2026 after reviewing the recent root-level worklog PDFs, the July 2 Git commit chain, current mobile source files, local syntax and whitespace checks, and the current working-tree state before this artifact was created.

Includes tracked Git work from commits 1c994c5 and 945200f, plus the current uncommitted follow-up in mob/app/shop.js that doubles each long cart divider and balances the product-entry spacing above and below divider sets. Together these changes moved the Shop overlays from static form polish into a more tactile, date-aware, production-feeling mobile checkout surface.

Source Materials Processed

- Read recent root-level PDF worklogs, especially June 26, June 27, and the June 30 / July 1 combined worklog, with pdftotext to preserve the established title cadence, compact summary opening, source-material section, baseline section, bullet-heavy work sections, validation section, follow-up context, and output-artifact close.
- Reviewed the July 2 Git history for commits 1c994c5 and 945200f, including commit messages, changed files, patch stats, and touched implementation areas for Shop form labels, Delivery date/time controls, haptics, and shared action-button feedback.
- Checked current source context in mob/app/shop.js, mob/styles/shopStyles.js, mob/app.json, mob/components/AppHeader.js, mob/components/ProductCard.js, mob/components/StickyCartButton.js, and mob/components/HapticPressable.js.
- Reviewed the active uncommitted diff in mob/app/shop.js for the filled-cart long-divider request, including the new doubled top divider, divider gap constant, and height balancing around product-entry image/name areas.
- Used git log, git show --stat, git diff --stat, git diff, git status, find, pdftotext, node --check, git diff --check, and a small standard-library PDF writer; no external PDF package was installed.

Current Baseline to Preserve

- Primary app work remains in /Users/prahlin/alla_vostra/mob, using Expo Router, React Native, and the shared Shop cart context.
- The Shop overlay order remains Products, Cart, Contact, Delivery, Payment, and Confirmed, with Stripe-backed card payment and Postmark confirmation email behavior already established on the June 30 / July 1 work chain.
- Shop forms now rely on in-field placeholder labels rather than small black labels above fields. Placeholders are larger, gray, and disappear while the field is focused or receiving input.
- Delivery now includes a Delivery Date & Time section above Delivery Address, with month/date dropdowns and hour/minute/AM-PM carousel-style controls.
- Haptic feedback is now part of the app interaction language. Shop form fields, dropdowns, checkbox controls, time toggles, and the broader app action buttons should continue to feel tactile on Android devices.
- The filled-cart product entry remains a sensitive 2x2 grid. Divider, margin, image, name, counter, and scrollbar math are coupled and should be changed together.

Main Goals We Worked Toward

- Replace small external labels across Shop overlays with larger in-field placeholder labels that feel softer and more readable on mobile.
- Make typed input readable inside taller form fields while preserving field geometry and preventing clipping or internal vertical scrolling.
- Reshape the Delivery Address section into more practical rows: Street Address with Unit #, then City, State, and ZIP with requested width ratios.
- Add a Delivery Date & Time area that gives customers a clear month/date and time-selection experience without crowding the address fields.

- Make time selection tactile through drag-responsive infinite-feeling vertical toggles, visible counter-style triangles, and vibration ticks.
- Extend haptic feedback beyond the Shop date controls into dropdowns, text fields, checkboxes, sticky/cart actions, product actions, and app navigation/action buttons.
- Refine filled-cart long divider spacing so doubled divider sets do not disturb the product-entry grid, while the outside gaps above and below each divider set feel even.

Work Completed - Shop Form Placeholder Labels

- Changed form-field naming across Shop overlays so field names appear inside the field before tapping rather than as small black labels above the field.
- Made placeholder names larger and gray, then brightened the gray after review so inactive field labels remain visible without becoming harsh.
- Kept placeholders out of the way while typing by hiding them when a field is focused or already has a value, preserving a clean input surface.
- Adjusted input font sizing and field text styling so customer-entered characters can be larger and more legible inside the taller form controls.
- Changed the typed field text color away from pure black toward a dark gray so user-entered text feels less severe against the light form fields.
- Matched Recipient name placeholder color to the normal field-label color before Gift is checked, then kept it hidden once Gift is checked as requested.
- Preserved the established Contact, Delivery, and Payment overlay form language while changing the label behavior underneath it.

Work Completed - Delivery Address Layout

- Moved State and ZIP onto the same row as City, making City 50 percent of the row, State 20 percent, and ZIP 30 percent between the existing margins.
- Changed the street row so Street Address occupies 80 percent and Unit # occupies 20 percent, matching the requested row weight without changing the wider overlay margins.
- Renamed Suite/Unit to Unit # and Street to Street Address, making the labels shorter where needed and clearer where the full address is required.
- Matched Unit # label sizing to the other field labels after the row split created a visible mismatch.
- Doubled the Only Florida prompt text size, left-aligned it to the overlay left margin, and tuned the vertical gap so the prompt sits with the same rhythm as the nearby form field spacing.
- Kept the Delivery Address section visually compact enough to leave room for the new Delivery Date & Time section above it.

Work Completed - Delivery Date and Month/Date Controls

- Inserted a Delivery Date & Time row above Delivery Address, giving delivery scheduling its own explicit section before address entry begins.
- Added a two-dropdown date combo: one dropdown for month and one dropdown for date.
- Provided all months and all date values as options, then abbreviated months to the first three letters except June and July, which remain fully spelled out.
- Adjusted dropdown proportions after iteration, landing on Month at 30 percent width and Date at 20 percent width, positioned from left toward center inside the form row.
- Kept dropdown tap and selection behavior aligned with the rest of the Shop field system rather than creating a disconnected date-picker surface.
- Added haptic ticks to dropdown taps and value selection so date choices feel responsive on Android devices.

Work Completed - Time Carousel Toggles

- Built three vertical scrolling time toggles for hour, minute, and AM/PM so customers can change delivery time by dragging through values.
- Made the toggle value lists behave like never-ending vertical carousels during continued dragging, allowing repeated movement without reaching a dead end.
- Changed the selected value behavior so only the active value fills the toggle viewing area at rest; adjacent values do not remain visible above or below until the user scrolls.

- Doubled the toggle font sizes, then removed the unboldened-value logic so the active value reads consistently rather than changing weight after release.
- Applied the app button rounding and border logic to the time toggles, then changed their fill to white with black text after the orange-fill pass was rejected.
- Scaled the toggle boxes down until the horizontal gaps between them matched the month/date dropdown gap language.
- Copied the counter asset up/down triangles above and below each toggle, doubled the vertical gaps around those triangles, and increased triangle width until each triangle matched its respective toggle width while retaining triangle height.
- Reduced vertical drag sensitivity by 25 percent so value changes feel less twitchy while dragging through time values.
- Added Android-style tick vibration while dragging through values, approximating the tactile feedback of an alarm-clock time picker.

Work Completed - Global Haptic Feedback

- Added mob/components/HapticPressable.js as a small reusable wrapper around Pressable that triggers a light Android vibration tick before running the wrapped press handler.
- Added Android VIBRATE permission to mob/app.json so vibration feedback can work in Expo/Android contexts.
- Applied haptic feedback to Shop dropdown opening, dropdown value selection, form-field taps, Gift/billing-style checkboxes, product Add, cart Add items, Remove, Continue, Checkout, Place order, and overlay back/forward triangle navigation.
- Extended the same action-button vibration behavior outside the Shop screen by routing AppHeader, ProductCard, and StickyCartButton presses through the haptic wrapper where appropriate.
- Kept the text-field tap feedback stronger and slightly delayed after an initial pass was too subtle to notice on Android/Expo Go.
- Preserved disabled-button behavior so unavailable controls do not become newly interactive just because the haptic wrapper exists.

Work Completed - Filled-Cart Divider Spacing Follow-Up

- Doubled each long horizontal divider in the cart overlay cream area, creating small paired divider sets between product entries.
- Added a divider-gap constant and a second top divider position so the pair is explicit in the layout math rather than drawn through duplicated offsets.
- Created invisible standalone spacing around divider sets while preserving the rule that there is no extra before-gap at the very top of the product list.
- Kept the internal 2x2 product-entry grid intact: product name/price, serving text, product image, counter, and remove button are not rearranged inside their cells.
- Balanced the gap above product names to the closest divider with the gap below product images to the divider below them, correcting the first pass where only the below-divider spacing had visibly changed.
- Recomputed product-entry total height from the image bottom, name-divider gap, and grid bottom so the doubled divider treatment changes outside spacing without pulling the asset grid out of alignment.

Validation and Checks Performed

- Freshly ran node --check mob/app/shop.js before generating this artifact.
- Freshly ran node --check mob/styles/shopStyles.js before generating this artifact.
- Freshly ran git diff --check -- mob/app/shop.js mob/styles/shopStyles.js mob/app.json mob/components/AppHeader.js mob/components/HapticPressable.js mob/components/ProductCard.js mob/components/StickyCartButton.js before generating this artifact; no whitespace or patch-format issues were reported.
- Reviewed git status before generating this artifact. The tree was not clean because mob/app/shop.js still contains the current filled-cart divider spacing follow-up, and that work is intentionally included in this July 2 worklog.
- Reviewed July 2 commit stats and source file lists for 1c994c5 and 945200f, confirming the tracked work touched Shop implementation, Shop styles, haptic wrapper, app-level action

components, and Android configuration.

- Did not run a fresh Expo export during this PDF-generation step. The recorded checks here are local syntax/whitespace checks plus source and history review.

Files Touched / Added During July 2

- Primary Shop implementation, placeholder state, form-field focus behavior, Delivery Date & Time controls, month/date dropdowns, time toggle logic, haptic hooks, checkbox feedback, cart divider spacing, and filled-cart row math: `mob/app/shop.js`.
- Primary Shop styling, placeholder and input text presentation, form row proportions, delivery scheduling controls, time toggle boxes, triangle sizing, and related overlay spacing: `mob/styles/shopStyles.js`.
- Global haptic press wrapper: `mob/components/HapticPressable.js`.
- App-level button feedback integration: `mob/components/AppHeader.js`, `mob/components/ProductCard.js`, and `mob/components/StickyCartButton.js`.
- Android vibration permission and app configuration update: `mob/app.json`.
- This final worklog generation creates `alla_vostra_worklog_july2.pdf` at the repository root.

Important Follow-Up Context

- The haptic system currently targets Android/Expo Go behavior most directly. iOS production builds may need separate tuning through Expo Haptics or native feedback if stronger parity is desired.
- The Delivery Date & Time UI is front-end selection state. A production order system should send the selected date/time through the backend order payload and include it in confirmation emails and eventual admin views.
- The date dropdown allows all dates for all months. A mature version should eventually restrict impossible month/date combinations, blackout dates, preparation windows, and store operating hours.
- The time carousel is custom UI. It should be checked on physical Android and iOS devices for drag feel, value wrapping, vibration strength, and accidental scroll conflicts inside the overlay.
- The placeholder-label system improves visual clarity, but every overlay form should still be checked with long names, long emails, keyboard open state, and smallest supported device widths.
- The filled-cart divider set is now even more layout-sensitive because each separator is paired. Future divider, scrollbar, asset-scale, and row-height changes should be tested with one-entry and multi-entry carts.
- The current uncommitted cart-divider adjustment should be committed after visual review if it matches the requested layout on-device.

Output Artifact

- Created this daily worklog PDF: `alla_vostra_worklog_july2.pdf`.
- The file is named for July 2 and placed at the repository root to follow the existing root-level worklog naming convention.
- No external PDF package was installed; this artifact was generated with a small standard-library PDF writer in the same plain-text-readable spirit as the prior daily worklogs.
