

Alla Vostra Mobile App Work Log - June 1, 2026

Compiled summary for June 1, 2026 - focus: mobile Expo/Android AppHeader polish, background1.png header spacing, sticky top-nav expansion behavior, and carousel arrow positioning.

Generated automatically on June 2, 2026 at the user request for the work completed yesterday, June 1, 2026.

Source Materials Processed

- Read local git history for June 1, 2026, which contained three focused commits between 8:16 PM and 9:00 PM EDT.
- Compared those commits against the current live mobile source in /Users/prahlin/Desktop/alla_vostra/mob.
- Preserved the existing worklog convention: US-letter PDF, Helvetica/Helvetica-Bold typography, footer with title and page number, concise implementation-oriented sections, and a root-level alla_vostra_worklog_* filename.

Current Baseline to Preserve

- Work remained focused on /Users/prahlin/Desktop/alla_vostra/mob. The desktop / other website was not the active editing target.
- The Expo Router mobile architecture remains active, with the persistent AppHeader mounted from app/_layout.js over Home, Products, About Us, and Contact.
- The main-screen hero is background1.png in AppHeader.js. It remains a persistent underlay beneath the transparent main-screen content.
- The split hero/header overlay architecture remains the accepted baseline: the hero-only layer sits behind the route content, and the visible orange bar / white carousel nav sits above it.
- Shop remains isolated from the shared white carousel navigation row and main-screen background hero behavior.
- Dream Avenue, TT Fors, the orange Alla Vostra brand bar, cream #FFF2CF surface, delayed first-divider spacing, center magnification, and the Android 36-layer radial shadow treatment remain part of the mobile design baseline.

Main Goals We Worked Toward

- Remove a small vertical whitespace gap that appeared between the white top nav bar and background1.png in the app header.
- Keep the top-nav sticky expansion from creating a visible blank strip while preserving the existing scroll-linked nav motion.
- Bring the carousel arrows closer to the active screen/link name so the header feels more visually focused.
- Preserve all existing route transition behavior, header swipe behavior, hero freeze behavior, and background1.png placement while making only targeted visual fixes.

Work Completed - Header / Hero Gap Fix

- Adjusted heroOnlySpacer in mob/styles/headerStyles.js from 204px to 200px to eliminate the small vertical gap below the top nav region.
- Introduced stickyExpansionMaxHeight = 20 in AppHeader.js so the sticky expansion behavior could be controlled from a named constant instead of relying on an implicit value.
- Reworked carouselStickyExpansion so it acts as a clipped wrapper and added carouselStickyExpansionFill as the actual cream fill layer.

- Changed the sticky expansion animation from a height-driven fill to a translateY-driven fill, keeping the fill stable while sliding it into place as the header reaches its sticky/top-nav-only state.
- Kept the expansion color as #FFFCF2 and avoided introducing any Android elevation/drop-shadow behavior that could recreate known nav artifacts.

Work Completed - Carousel Arrow Positioning

- Reduced carouselInner gap in mob/styles/headerStyles.js from 30px to 15px, bringing the left and right arrows twice as close to the active screen/link name.
- Reduced carouselActiveWrap minWidth from 190px to 140px so the active title area itself no longer forced the arrows too far away from center.
- Kept the existing arrow dimensions, chevron shape, opacity animation, idle timing, and tap/swipe behavior intact.
- Preserved the active title slide system, incoming/outgoing title layers, route push frame behavior, and shared header swipe context while tuning only the arrow-to-title spacing.

Files Touched During June 1

File	Purpose / Result
mob/styles/headerStyles.js	Adjusted heroOnlySpacer, split sticky expansion wrapper/fill styling, reduced carousel gap, and tightened active title wrap width.
mob/components/AppHeader.js	Added stickyExpansionMaxHeight, changed sticky expansion animation logic, and preserved header/swipe/route behavior around the visual fixes.
mob/components/.AppHeader.js.swp	A Vim swap-file artifact appeared in the June 1 git history and currently exists in the repository, but it is not part of app runtime logic.

Git / Commit Notes

- 9ef6617 - eliminated the small vertical whitespace gap between the top nav bar and background1.png by tuning heroOnlySpacer.
- f5cdec9 - began the arrow-spacing refinement and introduced the clipped sticky expansion fill approach for the top-nav region.
- 5d8723b - finalized the closer arrow placement by reducing the nav-row gap and active title wrap width.
- The repository was clean when this worklog was generated, except for this new PDF artifact after generation.

Important Constraints Going Forward

- Do not reintroduce the visible gap between the white top nav bar and background1.png when adjusting hero/header spacing.
- Do not replace the Android 36-layer radial shadow with elevation or shadowOpacity; those approaches previously created the wrong visual effect.
- Do not alter background1.png placement, opacity floor, freeze behavior, or main-screen transparent layering unless the task explicitly targets the hero system.
- Keep arrow spacing changes scoped to carousel layout values unless a future task intentionally redesigns the top-nav title/arrow system.
- Keep Shop isolated from the shared hero/top-nav behavior unless a later task explicitly changes the shop architecture.
- If repository cleanup is requested, review whether mob/components/.AppHeader.js.swp should be removed from version control as a non-runtime artifact.

Best Next Approach

- Test the June 1 header refinements on Android Expo Go at the original top state, during gentle vertical scroll, during fast scroll into the top-nav-only state, and while switching among Home, Products, About Us, and Contact.
- If the top-nav/background1 seam reappears, inspect heroOnlySpacer and carouselStickyExpansionFill together rather than changing the hero image itself.
- If arrow placement needs more tuning, adjust carouselInner gap and carouselActiveWrap minWidth as a paired visual system so the arrow/title relationship stays balanced.
- Continue making small, contained visual adjustments because the current header architecture has several interacting animated layers.

Closing Summary

The June 1 session was a focused mobile header polish pass. The main accomplishments were removing the thin gap between the top nav and background1.png, improving the sticky expansion fill behavior, and tightening the carousel arrow spacing around the active screen name. No broad architecture changes were made, and the existing overlay header, hero underlay, swipe navigation, route push frame, and Android radial shadow baseline remained intact.
