

Alla Vostra Mobile App Work Log - June 6, 2026 (Part 2)

Compiled summary for June 6, 2026 - focus: top navigation animation simplification, old-header chevron behavior, Android swipe/tap arrow state hardening, and shop-screen fade-overlay cleanup.

Includes tracked Git work completed after the June 6 part 1 worklog and terminal validation work performed during this individual session.

Generated automatically on June 6, 2026 at 9:07 PM EDT.

Source Materials Processed

- Read the existing June 6 part 1 worklog PDF to preserve title wording, footer cadence, section ordering, and compact report style.
- Reviewed Git history after the June 6 part 1 artifact, including commits 971da34, fe79479, fc13805, a525ae9, and 0ae38ef.
- Checked current repository status before generating this artifact to confirm no untracked implementation changes remained outside the requested worklog.
- Inspected the shop screen, layout wrapper, ScreenFade component, and relevant header/swipe utilities to describe the final active implementation.

Current Baseline to Preserve

- Primary development target remains /Users/prahlin/Desktop/alla_vostra/mob with Expo Router, a persistent AppHeader, and shared swipe/navigation context.
- The old header state now supports tap/hold arrow hints, while directional swipe navigation uses one-sided chevron feedback rather than both arrows.
- The top navigation label is intentionally instant/static during route changes to avoid the recurring stutter/clipping issues seen in the animated title version.
- Shop is treated as a separate route without the main-screen overlay header, but should still visually align with the same orange top-bar language.

Main Goals We Worked Toward

- Drastically smoothen the top navigation experience by removing irregular title motion and preserving only stable, intentional moving parts.
- Make Android Expo Go the primary behavioral target for chevron sizing, rendering, and swipe/tap interaction logic.
- Avoid simultaneous left/right chevron flashes during decisive swipes while still allowing both arrows as a deliberate steady tap-and-hold affordance.
- Remove the unattractive white faded overlay crossing the orange bar on the shop screen.

Work Completed - Top Nav Title Behavior

- Removed the previous slide-in/slide-out screen-name animation from the top nav bar after repeated stutter, pause, clipping, and timing issues.
- Replaced the moving title layers with a single stable label tied directly to the resolved active page.
- Preserved the orange indicator animation and page push/route transition behavior while eliminating the fragile animated text path.
- Updated app and web project snapshots as part of the tracked commit for the simplified navigation baseline.

Work Completed - Old Header Chevron Rendering

- Added old-header tap/hold chevron visibility so arrows can emerge over the top nav area and remain while the hold continues.
- Matched old-state chevron strength to the new-state arrow color/opacity so the visual language stays consistent.
- Iterated through Android rendering approaches for chevrons, including text glyphs and

stroke-based shapes, then returned to a single connected bordered chevron to avoid overlap discoloration.

- Reduced and rounded the chevron shape after testing size, jaggedness, separation, and dark-overlap artifacts.

Work Completed - Directional Swipe Feedback

- Moved directional chevron state into HeaderSwipeContext so both header carousel swipes and body/page swipes drive the same left/right arrow behavior.
- Implemented one-sided chevron lingering: swipe left suppresses the right chevron and keeps the left visible until the orange indicator settles; swipe right mirrors the behavior.
- Cleared directional lingering when swipes are cancelled, blocked by navigation gates, terminated, or when the indicator animation completes.
- Kept the old shared hold affordance separate from committed swipe feedback so press/hold and directional swipe behaviors do not fight each other.

Work Completed - Tap/Hold Arrow Hint Hardening

- Converted the both-chevron behavior into a true tap-and-hold hint rather than an immediate touch-start effect.
- Set the current steady-hold delay to 50ms and introduced movement cancellation so immediate left/right swipes do not show both chevrons unnecessarily.
- Made the hint idempotent so repeated touch-start events during the same hold do not reset opacity and cause appear/disappear flicker.
- Relaxed cancellation once the hint is visible so tiny steady-finger jitter does not hide both arrows during a legitimate hold.

Work Completed - Shop Screen Overlay Cleanup

- Identified the white faded band over the shop orange bar as the global ScreenFade layer, not the shop header itself.
- Updated ScreenFade to accept a configurable topOffset while preserving its default behavior for the main overlay-header pages.
- Set the shop route to start the fade at 120px, below the orange header, removing the wash over the top bar while keeping page-edge fade treatment elsewhere.

Validation and Checks Performed

- Ran node --check against modified JavaScript files during implementation passes, including AppHeader, HeaderSwipeContext, useMainScreenSwipeNavigation, MainScreenPushFrame, ScreenFade, and _layout where relevant.
- Ran git diff --check on touched files to catch whitespace and patch-format issues before final handoff.
- Ran repeated Android exports with npx expo export --platform android --output-dir /tmp/alla_vostra_mob_android_export to validate the Expo Go target path.
- Ran web export with npx expo export --platform web --output-dir /tmp/alla_vostra_mob_web_export after shop fade work to refresh the browser preview.
- Checked the local static preview server root response after the web export to confirm the refreshed bundle was being served.

Files Touched / Added During June 6 Part 2 (from tracked commits)

- Modified: mob/components/AppHeader.js, mob/styles/headerStyles.js, mob/utils/headerSwipeContext.js, mob/utils/useMainScreenSwipeNavigation.js, mob/components/MainScreenPushFrame.js.
- Modified: mob/components/ScreenFade.js and mob/app/_layout.js for shop-screen fade placement.

- Modified snapshots during the top-nav simplification commit:
alla_vostra_APP_PROJECT_SNAPSHOT.txt and alla_vostra_WEB_PROJECT_SNAPSHOT.txt.
- No new runtime dependency or external PDF tool was installed; this PDF was generated with the same standard-library PDF approach used by the prior worklog artifact.

Output Artifact

- Created this worklog PDF: alla_vostra_worklog_june6_part2.pdf.
