

Alla Vostra Work Log – May 23, 2026 (Part 1)

Compiled summary for May 23, 2026 – focus: Android header radial gradient improvement

Current Baseline to Preserve

- The May 23 work built upon the May 16 baseline where the mobile header used a drop shadow to fake a radial gradient on Android. The web version already used a proper CSS radial gradient on `.carouselCenterShadow``.
- Header and navigation layout, fonts (Dream Avenue for the logo and TT Fors for body text), colours, spacing and responsive breakpoints from prior snapshots remain unchanged and must be preserved.
- No new assets or images were introduced in this worklog; the focus was exclusively on replicating the web radial gradient for Android.

Main Goal We Were Trying to Achieve

- Recreate the subtle radial shadow behind the carousel navigation on Android so that the edges are completely transparent and opacity increases exponentially toward the centre, matching the web's CSS radial gradient.
- Ensure the solution does not rely on Android's ``shadowOpacity``/``elevation`` parameters, which create a linear drop shadow rather than a radial wash.
- Maintain existing header behaviour (sticky nav on scroll, announcement bar and hero interactions) and avoid changing unrelated layout, images or typography.

Attempts Made / Work Completed

Work item	Purpose	Result / note
Removed Android drop shadow	Set <code>`shadowOpacity`</code> and <code>`elevation`</code> to zero	The carousel barely came in sight, Android still lacked radial gradient
Multi-layer gradient (9 layers)	Stacked nine concentric <code>`View`</code> s with decreasing sizes and slightly increasing opacities	Looking better than slightly blurry drop shadow, but still not quite right
Increase circle size by 50%	Scaled each gradient layer's width, height	The edges of the gradient were softer, the edges became less defined
Double the number of layers (18)	Added nine additional layers with interpolated opacities	Edges improved, but the overall effect remained too dark, the opacity was still not quite right
Double layers again (36) and halve the opacity	Created 36 concentric layers with sizes decreasing by 45% per layer	This produced a very soft, hazy gradient. Opacity was still not quite right

Complaints / Constraints to Remember Going Forward

- Edges of the carousel shadow must be fully transparent; opacity should ramp up gradually and exponentially toward the centre.
- Do not use Android's ``shadowOpacity`` or ``elevation`` properties, as they create a drop shadow rather than a radial gradient.
- Do not adjust the sizing, cropping, or tint of background images, announcement bars, nav bar, or hero sections unless explicitly requested.
- When the user asks for 'pfs,' provide the full script, not snippets, and maintain all fonts, colours, spacing, and alignment from the baseline.

- Keep row/line number instructions precise and avoid ambiguous partial replacements when giving code changes.

Best Next Approach / Next Steps

- Validate the 36 layer gradient on a range of Android devices and screen sizes to confirm that banding is no longer perceptible.
- Measure performance impact of rendering 36 overlapping `View`s; if necessary, explore native modules or custom shaders for radial gradients.
- Continue with Part 2 to integrate the new gradient into the full project, ensuring that navigation animations and hero scaling still function correctly after these style changes.
