

Alla Vostra Mobile App Work Log - August 24, 2026

Compiled summary for Monday, August 24, 2026 - focus: post-August-16 production release finalization, Android 15 and Android 16 Play Console compatibility remediation, Expo/Android production build preparation, EAS archive hardening, PayPal live credential onboarding, Stripe/Vercel/Postmark readiness checks, Play Console production release upload, release-note wording, Data safety declaration repair, live privacy-policy contact correction, and current documentation artifact generation for Alla Vostra.

Generated in continuity with the established Alla Vostra worklog cadence: compact opening summary, source-material review, baseline, goals, grouped work-completed sections, validation, files touched, external account state, follow-up context, and output-artifact close.

This artifact is named `alla_vostra_worklog_august24.pdf` because the repository U.S. Eastern-time date used for generation was Monday, August 24, 2026, and no earlier August 24 root-level Alla Vostra worklog PDF existed. It records the work window after the August 16 PDF worklog commit 93b9021, through the synced source state at b0eaa65 Prepared Android production release 1.0.3, plus the Play Console, PayPal, Vercel, and privacy-policy release operations completed after that source commit.

Source Material Reviewed

- Reviewed all 59 pre-existing root-level Alla Vostra PDF worklogs from May, June, July, August 1, August 10 Parts 1-3, August 11, August 12 Parts 1-2, August 14, and August 16 to preserve the project naming pattern, page format, section order, validation language, files-touched inventory, follow-up cadence, and output-artifact close.
- Extracted recent PDFs with `pdftotext` and inspected the full PDF set with `pdftinfo`, using the August 10, August 11, August 12, August 14, and August 16 mobile-app worklogs as the closest style anchors because they define the current long-form release-documentation shape.
- Reviewed git history from 93b9021 through b0eaa65 and inspected the latest commit message, name-status output, diff stat, and changed-file surface so this PDF is grounded in tracked source rather than only conversational memory.
- Inspected the current mobile release files: `mob/app.json`, `mob/.easignore`, `mob/package.json`, `mob/package-lock.json`, and `mob/plugins/with-android-material-components-theme.js`.
- Reviewed the current project snapshots, payment-flow source references, and release-checklist context to keep the documentation aware of app, backend, Play Store, and production-checkout surfaces.
- Reviewed the server payment/contact routes and helper files indirectly through the server test surface and production smoke checks: payment-sheet, PayPal create/capture, Stripe webhook, contact-message, health, shared order pricing, PayPal utilities, and Postmark utilities.
- Reviewed the Play Console state from the release session screenshots and text: Closed testing versus Production navigation, production release creation, AAB upload, country selection, release notes, quick-check behavior, Data safety blocker, and final Publishing overview state.

- Reviewed the PayPal Business and Developer Dashboard onboarding path, including the move from dashboard/payment-link confusion into live REST app credentials and Vercel production environment configuration.
- Reviewed the live privacy-policy page at <https://allavostra.com/privacy> after the email correction, confirming the page now exposes the working sales.allavostra@gmail.com privacy/contact address.

Baseline Status Before August 24

- The August 16 worklog left the app with live Stripe/Vercel checkout infrastructure, shared server-side order pricing, PayPal create/capture route support, and Postmark confirmation support, but PayPal live account onboarding still needed to be completed before public PayPal payments could be treated as ready.
- The prior production candidate was documented around version 1.0.2 / Android version code 3, while Play Console and Android platform guidance later required a cleaner Android display-compatibility pass before public release.
- Google Play Console warned about Android 15 edge-to-edge behavior, deprecated status/navigation/window display APIs, and Android 16 large-screen orientation/resizability restrictions for the closed-test release track.
- The app was close to production but still needed a fresh Android App Bundle with a higher version code, updated Android configuration, and proof that the generated native project no longer carried the risky manifest/window-display settings.
- The release path initially sat in Closed testing, which would have limited distribution to selected testers rather than pushing the app publicly in the chosen production country.
- Play Console Data safety was incomplete and later blocked submission because Google required disclosure of all user data sent off-device, including SDK/library data and WebView-related transfers.
- The public privacy policy had a deletion-request URL available, but the earlier hello@allavostra.com address bounced because the remote mail server was misconfigured.
- The project launch checklist still contained some older 1.0.2 / versionCode 3 wording, so the current source and AAB became the authoritative production-release reference for this worklog.

Goals for August 24

- Finalize an Android production release candidate that could be uploaded to Play Console as version 1.0.3 / version code 4.
- Address the Android 15 and Android 16 Play Console warnings without destabilizing the Expo-managed app structure or reintroducing generated-native source into git.
- Repair the EAS upload/archive surface so production builds include required PNG assets and app source files while avoiding bulky repository artifacts.
- Finish PayPal live credential setup for Vercel Production so PayPal could move from account-blocked to release-ready infrastructure.
- Confirm Stripe, PayPal route, Postmark route, and Vercel API readiness with safe smoke checks that do not create unnecessary live charges.
- Guide the Play Console upload into Production rather than Closed testing, with release notes that honestly mention display polish, UI layout refinement, and payment readiness.

- Complete the Data safety questionnaire accurately enough to clear Google quick checks, including device identifiers and data deletion request handling.
- Update the public privacy policy contact address to a working official business email and verify that the live privacy URL reflects the change.
- Leave future-session risk points clear: Google review outcome, real installed-from-Play checkout test, PayPal capture test, order email confirmation, and stale checklist cleanup.

Work Completed - Android Production Release Configuration

- Bumped the mobile app identity in mob/app.json from version 1.0.2 to version 1.0.3 and Android version code 3 to version code 4 so Google Play would accept a fresh production upload.
- Changed the Android orientation setting from portrait to default, removing the portrait-only restriction that Play flagged as risky for tablets, foldables, Chrome OS, Android XR, and future Android 16 large-screen behavior.
- Kept android.edgeToEdgeEnabled enabled while removing the static androidStatusBar block from app.json, avoiding deprecated Android 15 status-bar color configuration.
- Removed the androidNavigationBar backgroundColor value while keeping the dark-content bar style and enforceContrast false behavior, reducing deprecated window-display parameters without throwing away the intended visual baseline.
- Removed the expo-navigation-bar plugin configuration from app.json so the production build no longer injects the older navigation-bar background, border, position, and behavior parameters that Play was warning about.
- Kept the Stripe React Native plugin configured with merchantIdentifier merchant.com.allavostra and enableGooglePay true for the production payment build.
- Updated Expo from ~54.0.36 to ~54.0.37 and expo-constants from ~18.0.13 to ~18.0.14, then refreshed the package lockfile to keep the Expo SDK patch state internally consistent.
- Preserved the existing app name, package id com.allavostra.app, scheme allavostra, app icon, adaptive icon, splash assets, VIBRATE permission, and EAS project id while narrowing the release change to Android display compatibility and production identity.

Work Completed - Android Config Plugin Hardening

- Reworked mob/plugins/with-android-material-components-theme.js away from withDangerousMod filesystem rewriting and into Expo config-plugin manifest/styles mods.
- Added a manifest mod that removes android:screenOrientation from MainActivity in the generated AndroidManifest, so regenerated native projects stop carrying a fixed-orientation activity declaration.
- Added a styles mod that sets the AppTheme parent to Theme.MaterialComponents.DayNight.NoActionBar.Bridge through AndroidConfig.Styles instead of using regular-expression replacements against generated XML.
- Removed android:statusBarColor from the generated AppTheme style so Play Console no longer sees the static status-bar color parameter it warned about for Android 15 edge-to-edge behavior.
- Removed the old injected MainActivity window code that called WindowCompat.setDecorFitsSystemWindows, assigned transparent status/nav bar colors, and set light-status/light-navigation appearance flags in Kotlin.

- Dropped the old fs/path import and direct MainActivity source mutation path, leaving the plugin shorter, declarative, and compatible with future Expo prebuild regeneration.
- Placed the Material Components plugin after the Stripe and blank-splash plugins in app.json so the theme cleanup runs at the end of the Android config chain.
- Verified the generated Android project scan no longer matched screenOrientation, resizeModeActivity, statusBarColor, navigationBarColor, WindowCompat, decorFitsSystemWindows, display-cutout, or Android window property patterns after the prebuild/build pass.

Work Completed - EAS Archive and Production AAB

- Hardened mob/.easignore so the EAS archive excludes .git, .venv, .vercel, editor folders, snapshots, worklog PDFs, generated native projects, dist/build output, logs, and local env files.
- Anchored legacy root-level ignore patterns such as /*.html, /*.css, /shop.js, /shopStyles.js, /test.js, and /*.py so EAS no longer excludes app source files or nested JavaScript that the mobile bundle needs.
- Added explicit EAS archive exceptions for payment marks, store icons, splash images, adaptive foreground, Play Store gradient, and the smiley storyboard sprite atlas so required release PNG assets survive upload.
- Repaired EAS build failures caused by overbroad ignore rules, including missing required PNG assets and app source exclusions, before reaching a successful production AAB.
- Built the production Android App Bundle through EAS for app version 1.0.3 / Android version code 4.
- Recorded the finished EAS build id as a5f95c51-1762-4bf0-96a4-54c6a0b233f0 and the artifact URL as https://expo.dev/artifacts/eas/Lck7QS-h42L-DGPPLgtC5erEg1fUy_45hqGGgLsasZc.aab.
- Downloaded the production AAB locally to /Users/prahlin/Downloads/Alla-Vostra-1.0.3-code4.aab.
- Verified the local AAB file was present at 81M on August 24 and calculated SHA-256 ce2ce41934abba040d95fa56a77372fa085912d21abbe30d0dc21cf6d204046f.
- Committed the Android production-release source work as b0eaa65 Prepared Android production release 1.0.3, with app config, plugin, package, .easignore, and snapshot changes tracked.

Work Completed - PayPal, Stripe, Vercel, and Postmark Readiness

- Guided PayPal setup away from payment links/buttons and into the PayPal Developer Dashboard live applications path, because the app integration needs REST API Client ID and Secret credentials rather than a hosted PayPal button snippet.
- Worked around the initial PayPal Developer Dashboard unauthorized state by using the business account onboarding/dashboard path until live credential access was available.
- Added the PayPal live Client ID and Client Secret to Vercel Production after the user copied both values, keeping the secret values out of source and out of this worklog.
- Kept PAYPAL_ENVIRONMENT set to live in Vercel Production so the existing backend PayPal create/capture helpers target live PayPal APIs instead of sandbox APIs.

- Confirmed Stripe was already configured for real payment-method readiness from the prior live-payment work, with the live publishable key in EAS and live secret/webhook variables in Vercel.
- Confirmed Postmark remained part of the deployed backend readiness surface through the existing contact-message and payment confirmation route tests.
- Ran safe production smoke checks against Vercel without initiating a real customer charge: health returned ok, Stripe payment-sheet reached Cart is empty validation, PayPal create-order reached Cart is empty validation, Stripe webhook enforced Missing Stripe signature, and contact-message returned form validation.
- Left the final real-world payment verification intentionally open: a Play-installed build still needs a real Stripe payment test, a PayPal approval/capture test, and corresponding order-email verification after review/install access is available.

Work Completed - Play Console Production Release

- Clarified that uploading to Closed testing would only make the release available to selected testers, while uploading under Test and release > Production creates the public production review path for the chosen countries.
- Directed the release flow into Production, not the Closed testing track, after the Play Console page showed the user was initially creating a closed test release.
- Uploaded the version 1.0.3 / version code 4 AAB to the Production release form.
- Used release name Alla Vostra 1.0.3 production release 1 for the production upload.
- Prepared concise production release notes that mentioned Android display behavior, visual layout polish, checkout readiness, and PayPal/Stripe production payment support.
- Resolved the Play Console country/region blocking error by adding United States as the production rollout country.
- Interpreted the deobfuscation-file warning correctly as non-blocking for this release because it only affects crash-symbol readability for obfuscated/minified Android code.
- Saved and submitted the production release changes from Publishing overview after Google completed or deferred the quick-check gate.
- Confirmed Publishing overview later showed Changes in review with Production / Alla Vostra 1.0.3 production release 1 / Start full rollout and App content / Data safety questionnaire.
- Noted that Managed publishing was off, meaning an approved production review can publish automatically rather than waiting for a later manual publish button.

Work Completed - Data Safety and Privacy Policy

- Reopened Play Console Data safety after Google quick checks reported an Invalid data safety declaration for undeclared data transmitted off users devices.
- Set Data collection and security to disclose that the app collects or shares required user data types and that data is encrypted in transit.
- Declared that the app does not allow users to create an account and that users cannot log in with accounts created outside the app, matching the current no-account ordering flow.
- Answered the optional deletion-request question as Yes and used <https://allavostra.com/privacy> as the Delete data URL because the privacy page describes how users can request deletion by contacting Alla Vostra.

- Confirmed the selected Personal info types covered Name, Email address, Address, and Phone number.
- Confirmed the selected Financial info types covered Purchase history and User payment info, reflecting order/payment processing through Stripe, PayPal, Apple Pay, Google Pay, and related providers where available.
- Confirmed the selected Messages type covered Other in-app messages, reflecting contact form and support/inquiry messages sent through the app/website.
- Added Device or other IDs after recognizing that payment/security SDKs and backend logs may transmit device, app, browser, server-log, and transaction identifiers off-device.
- For Device or other IDs, selected collected and shared, not processed ephemerally, required collection, and purposes App functionality plus Fraud prevention, security, and compliance; advertising/marketing was not selected.
- Guided the user to save Data safety, return to Publishing overview, and submit changes for review again once quick checks ran.
- Updated the live privacy policy contact/request address from the broken `hello@allavostra.com` mailbox to `sales.allavostra@gmail.com` and removed the placeholder mailing-address line from the final shared policy text.
- Verified the live privacy page contains the working `sales.allavostra@gmail.com` mailto links and deletion/privacy-request language, with no `hello@allavostra.com` or Insert business placeholder present in the checked output.

Validation and Checks Performed

- Ran `node --check mob/plugins/with-android-material-components-theme.js` after the Android config-plugin rewrite; no syntax errors were reported.
- Ran `npm expo config --type public --json` in mob and confirmed name Alla Vostra, version 1.0.3, orientation default, Android package `com.allavostra.app`, Android `versionCode` 4, `edgeToEdgeEnabled` true, and the expected plugin list.
- Ran `npm expo install --check` in mob; dependencies were reported up to date.
- Ran `npm expo-doctor` in mob; all 18 checks passed with no issues detected.
- Ran `server npm test`; `node --check` passed for payment-sheet, PayPal create-order, PayPal capture-order, Stripe webhook, contact-message, health, orders, PayPal helpers, Postmark helpers, and local-dev-server.
- Scanned the generated Android project for deprecated/restricted display patterns including `screenOrientation`, `resizeableActivity`, `statusBarColor`, `navigationBarColor`, `WindowCompat`, `decorFitsSystemWindows`, `display-cutout`, and Android window properties; no matches were returned.
- Verified the local production AAB path, size, and SHA-256 checksum after the EAS production build completed.
- Verified the live Vercel health endpoint returned `{"ok":true,"service":"alla-vostra-stripe-server"}`.
- Verified the live Stripe payment-sheet endpoint with an empty payload returned HTTP 400 Cart is empty, indicating Stripe configuration is loaded far enough to reach order validation.
- Verified the live PayPal create-order endpoint with an empty payload returned HTTP 400 Cart is empty, indicating the route is deployed and shared order validation is active.

- Verified the live Stripe webhook endpoint rejects unsigned requests with HTTP 400 Missing Stripe signature.
- Verified the live contact-message endpoint rejects an invalid/empty contact payload with HTTP 400 validation instead of deployment failure.
- Verified the live privacy-policy URL exposes the Gmail privacy request address and deletion-request wording needed for the Play Console Data safety URL.
- Did not run a real live Stripe charge, PayPal capture, or installed-from-Play purchase during this documentation pass.
- Did not receive final Google Play approval during this documentation pass; the release state recorded here is in review.

Files Touched During the August 24 Source Window

- mob/app.json - bumped version to 1.0.3, bumped Android versionCode to 4, removed the portrait-only orientation lock, removed deprecated status/navigation bar configuration, removed expo-navigation-bar plugin config, and preserved production Stripe/Google Pay app plugin configuration.
- mob/plugins/with-android-material-components-theme.js - replaced dangerous generated-file rewrites with Android manifest and styles mods that remove MainActivity orientation, set the Material Components theme parent, and remove android:statusBarColor.
- mob/.easignore - tightened EAS upload contents by excluding bulky local/repo artifacts, anchoring root legacy ignores, and allowing required store, payment, splash, and tutorial PNG assets into the production build archive.
- mob/package.json and mob/package-lock.json - updated Expo and expo-constants patch versions and refreshed the lockfile for the production release candidate.
- alla_vostra_APP_PROJECT_SNAPSHOT.txt and alla_vostra_WEB_PROJECT_SNAPSHOT.txt - changed in the production-release source commit as part of the project snapshot refresh; current source files remain the authoritative reference for version 1.0.3 / code 4.
- alla_vostra_worklog_august24.pdf - generated by this documentation pass as the latest root-level PDF worklog artifact.

External Configuration and Account State

- Google Play Console has the production release Alla Vostra 1.0.3 production release 1 in review with Start full rollout listed under Production.
- Google Play Console also has the updated Data safety questionnaire in review as part of App content.
- Managed publishing is off in Play Console, so approval can move the production release toward publication without a separate managed-publishing release step.
- The production rollout country shown during setup was United States.
- PayPal live REST credentials were copied by the user and added to Vercel Production during the release setup flow; this worklog records their presence only, not their values.
- Stripe live checkout remained configured through Vercel and EAS from the prior production-payment pass, with safe route-level checks still passing after the August 24 release work.
- Postmark remained the app email provider for contact and order-confirmation flows; route syntax and contact-route deployment checks remained healthy.

- The live privacy policy is hosted at allavostra.com/privacy and now lists sales.allavostra@gmail.com for privacy requests and contact, aligning the Play Console deletion URL with a working address.
- The allavostra.com domain email hello@allavostra.com still appears operationally broken from the user-supplied bounce report and should not be used for Play review contact until Hostinger/Titan mail is fixed.

Follow-up Context for Future Sessions

- Wait for Google Play review on the production release and Data safety changes; if Google rejects the release, use the exact Play policy issue text as the next source of truth.
- After approval or install access, test the Play-installed app rather than only Expo/dev builds: launch, tutorial, shopping flow, contact form, delivery details, payment method selection, Stripe card payment, PayPal approval/capture, order confirmation, and email delivery.
- If a real Stripe payment is tested before public ordering, verify Stripe dashboard status, Postmark email delivery, refund path, and customer-visible order messaging, then document the result in the next worklog.
- If PayPal is tested before public ordering, verify the create-order, approval redirect, app return URL, capture endpoint, PayPal dashboard status, and confirmation email together; PayPal is not fully proven until capture succeeds.
- Keep sales.allavostra@gmail.com as the Play/privacy contact unless the hello@allavostra.com mailbox is repaired and tested with a successful inbound message.
- Update `PLAY_STORE_LAUNCH_CHECKLIST.md` in a future source commit because it still contains older 1.0.2 / versionCode 3 production-candidate wording even though the source/AAB truth is now 1.0.3 / code 4.
- Keep Data safety synchronized with future changes: adding analytics, advertising SDKs, accounts, location, file uploads, push notifications, or new webviews may require new declarations.
- Commit this August 24 worklog as a documentation-only artifact if following the recent project pattern of source commit first, PDF worklog commit second.

Output Artifact

- Created `alla_vostra_worklog_august24.pdf` at the repository root as the latest customary PDF worklog for the Alla Vostra project.
- Used the established root-level worklog filename pattern because this was the first August 24 worklog artifact, so no part suffix was required.
- Preserved the current letter-size PDF convention, footer format, concise opening summary, section ordering, bullet-heavy documentation style, validation language, files-touched detail, external-account context, follow-up section, and output-artifact close.
- This PDF records the August 24 production-release finalization work: Android display-compatibility remediation, EAS archive fixes, production AAB build, PayPal live credential setup, Stripe/Vercel/Postmark smoke checks, Play Console production submission, Data safety repair, live privacy-policy email correction, and remaining launch risks.
